Pressing the **Reset** button, located on the front panel, initiates a hardware warm reboot. The button plays the same role as a desktop PC's reset button. After pressing the reset button, the system will reboot automatically. DO NOT use the Reset button under normal conditions; use it only if the software is not working properly. To protect the integrity of data being transmitted or processed, you should always reset the system via the operating system using the software reboot function.

# **Real Time Clock (RTC)**

The RKP-A110's real-time clock is powered by a lithium battery. You can easily replace the battery yourself using an optional battery kit. Refer Replacing the RTC Batteryy section for details. However, please note that there is a risk of explosion if the battery is replaced by an incorrect type of battery. Contact a qualified Moxa support engineer if you have any questions about the RTC battery.

### ATTENTION

There is a risk of explosion if the battery is replaced by a battery of the incorrect type.

The RKP-A110 Series computers are compact and rugged, making them suitable for industrial applications. The LED indicators allow users to monitor performance and quickly identify trouble spots. Multiple ports are provided for connecting a variety of different devices. The RKP-A110 Series computers come with a reliable and stable hardware platform that lets you devote the bulk of your time to application development. This chapter describes the hardware installation and connector interfaces of the RKP-A110 computers.

# **Installing Rack-mounting Ears**

The RKP-A110 computer comes preinstalled with two rack-mounting ears. If they are not, use the rackmounting kit to install the ears. The rack-mounting kit includes 2 rack-mounting ears and 8 screws (size: M4x6), four for each mounting ear.

After installing the rack-mounting kit, do the following to install the computer on a rack.

#### Step 1.

If the mounting ears are not installed, use four screws each to attach the mounting ears on both sides of the computer.

#### Step 2:

Place the computer on a rack and use another four screws to secure the rack-mount ears to the rack.

The second set of four screws needs to be purchased separately. Refer to the figure on the right for the specifications.

# **Connecting the Power**

The RKP-A110 computers are provided with 2-pin power input connectors in a terminal block on the front panel. Insert the power-cord wires into the connectors and tighten them to secure the wires in place. Plug in the power cable to a power source. The power LED will light up to indicate that power is being supplied to the computer. It should take about 30 to 60 seconds for the operating system to complete the boot-up process.

| Pin |   | Definition |
|-----|---|------------|
|     | 1 | V+         |
|     | 2 | V-         |

The power input specification is given below:

The DC power source rating is 12 VDC @ 5.4 A, or 24 VDC @ 2.6 A. An 18 AWG cable size DC power is suggested.

#### ATTENTION

This product is intended to be supplied by a Listed Power Supply with output marked LPS and rated to deliver 12 VDC at a maximum of 5.4 A, or 24 VDC at a maximum of 2.6 A, and minimum Tma=60°C. If you need assistance with purchasing a power adapter, contact the Moxa technical support team.

.

#### ATTENTION

Before connecting the RKP-A110 computer to the DC power inputs, ensure that the DC power source voltage is stable.

- The wiring for the input terminal block shall be installed by qualified and experienced professionals.
   Wire Type: Cu, FW2
  - Use 18-12 AWG wire size and a torque value of 0.5 N-m.
- Use only one conductor in a clamping point between the DC power source and the power input.

### NOTE

If using Class I adapter, the power cord adapter should be connected to a socket outlet with an earthing connection or the power cord and adapter must comply with Class II construction.

### NOTE

For surge protection, connect the grounding connector located below the power connector with the earth (ground) or a metal surface.

An 18 AWG cable size conductor must be used when the connection to the external grounding screw is utilized. The heat sink is grounded to the chassis by an internal screw.

#### WARNING

為避免電磁干擾,本產品不應安裝或使用於住宅環境。

# **Wiring Requirements**

The following common safety precautions should be observed before installing any electronic device:

 Power wires and communication/signal wires should be routed through separate paths. If power and communication/signal wires must cross paths, make sure the wires are perpendicular at the intersection point.

#### NOTE

Do not run signal or communication wiring and power wiring in the same wire conduit. To avoid interference, wires with different signal characteristics should be routed separately.

- Use the type of signal transmitted through a wire to determine which wires should be bundled together and which ones should be kept separate. The rule of thumb is that wiring that carries similar electrical signals can be bundled together.
- When necessary, we strongly advise labeling the wiring for all devices in the system.

#### **ATTENTION**

Do not run signal or communication wiring and power wiring in the same wire conduit. To avoid interference, wires with different signal characteristics should be routed separately.

#### ATTENTION

#### Safety First!

Be sure to disconnect the power cord before installing and/or wiring your device.

#### **Electrical Current Caution!**

Calculate the maximum possible current in each power wire and common wire. Observe all electrical codes dictating the maximum current allowable for each wire size.

If the current goes above the maximum rating, the wiring could overheat, causing serious damage to your equipment.

#### Temperature Caution!

Be careful when handling the unit. When the unit is plugged in, the internal components generate heat, and consequently the outer casing may feel hot to the touch.

### **Restricted Access Location**

This equipment is intended to be used in Restricted Access Locations, such as a computer room, with access limited to SERVICE PERSONAL or USERS who have been instructed on how to handle the metal chassis of equipment that is so hot that special protection may be needed before touching it. The location should only be accessible with a key or through a security identity system.

# **Ethernet Ports**

The RKP-A110 has 4 or 12 Ethernet ports. When a LAN cable is properly connected, the LEDs on the front panel will glow to indicate the connection status.

| Pin | 10/100 Mbps | 1000 Mbps |

# **Upgrading the BIOS**

This section describes how to upgrade the BIOS on your computer.

#### NOTE

Incorrect BIOS updates may permanently damage the computer. We strongly recommend that you contact the Moxa technical support team for assistance in obtaining all the necessary tools and the most current information before attempting to upgrade the BIOS on any Moxa device.

#### Step 1: Create a Bootable USB Disk

Before upgrading the BIOS, you must create a bootable USB drive for the system.

- 1. Insert a USB disk in the computer's USB drive.
- 2. Search for "format" and select Create and format hard disk partitions.

#### Step 2: Prepare the Upgrade File

You must use the BIOS upgrade installation file to upgrade the BIOS. Contact Moxa's technical department for assistance.

- 1. Get the BIOS upgrade file (includes an **efi** folder and an **xxxx.efi** file)
- 2. Copy the efi folder and xxxx.efi file to the bootable USB disk.

#### Step 3: Run the Upgrade Program on the Computer

1. Reboot the computer from the USB device and press **F2** while it is booting up to go to the Boot Manager.

If the BIOS does not recognize the USB device as the boot device, the USB device may not have a partition table. Use the Windows command line tool **diskpart** to rebuild the partition table.

2. Select the USB disk to boot from.

The screen will switch to the SHELL environment.

3. Type **fs0:**, then go to the directory where the upgrade file is located and type **xxxxx.efi** (the name of the file is based on the upgrade file you get from Moxa).

4. The upgrade program will run automatically. Wait for the process to complete.

#### ATTENTION

Do NOT switch off the power supply during the BIOS upgrade, since doing so may cause the system to crash.

5. When the upgrade is done, the computer will automatically reboot. You can check the BIOS version on the Main page.

# A. Safety Installation Instructions

#### A. RTC Battery Warning

#### ATTENTION

There is a risk of explosion if the wrong type of battery is used. To avoid this potential danger, always be sure to use the correct type of battery. Contact the Moxa RMA service team if you need to replace your battery.

#### Caution

There is a risk of explosion if the battery is replaced by an incorrect type. Dispose of used batteries according to the instructions on the battery.

#### **B. Fuse Warning**

CAUTION: For continued protection against fire, replace only with the same type and rating of fuse.

#### C. Rack-mounting Warning

The following or similar rack-mounting instructions are included with the installation instructions:

(1) Elevated Operating Ambient: If installed in a closed or multi-unit rack assembly, the operating ambient temperature of the rack environment may be greater than the room ambient temperature. Therefore, consideration should be given to installing the equipment in an environment compatible with the maximum ambient temperature (Tma) specified by the manufacturer.

(2) Reduced Air Flow: Installation of the equipment in a rack should be such that the amount of air flow required for safe operation of the equipment is not compromised.

(3) Mechanical Loading: Mounting of the equipment in the rack should be such that a hazardous condition is not achieved due to uneven mechanical loading.

(4) **Circuit Overloading:** Consideration should be given to the connection of the equipment to the supply circuit and the effect that overloading of the circuits might have on overcurrent protection and supply wiring. Appropriate consideration of equipment nameplate ratings should be used when addressing this concern.

**(5) Reliable Grounding:** Reliable grounding of rack-mounted equipment should be maintained. Particular attention should be given to supply connections other than direct connections to the branch circuit (e.g., by using power strips).
