Overview

In this chapter, we introduce the basic features and specifications of the NPort W2150A-W4/W2250A-W4 Series and NPort W2150A-W4/W2250A-W4 Series-T, referred to collectively as the NPort W2150A-W4/W2250A-W4 Series.

The NPort W2150A-W4/W2250A-W4 Series of wireless device servers are used to connect RS-232/422/485 serial devices or Ethernet devices, including PLCs, meters, and sensors, to a wireless LAN. Your communications software will access serial devices or Ethernet devices from anywhere over a local LAN, WLAN, or the Internet. Moreover, the WLAN environment offers an excellent solution for applications in which the serial devices and Ethernet devices are moved frequently from place to place.

The NPort W2150A-W4/W2250A-W4 Series supports automatic IP configuration protocol (DHCP) and manual configuration using a standard web browser. Both IP configuration methods ensure quick and effective installation. In addition, a utility called "NPort Windows Driver Manager" makes port mapping easy.

The external antenna can be adjusted for maximum signal strength. You can also choose to use your own antenna for additional flexibility and scalability. A signal strength indicator on the front panel makes it easier for you to troubleshoot any connection problems.

The NPort W2150A-W4/W2250A-W4 Series offers different operation modes to ensure compatibility with standard network APIs, including TCP Server Mode, TCP Client Mode, and UDP Mode. Real COM/TTY drivers are provided to allow legacy serial-based software to communicate over an IP network instantly. This preserves your software investment while providing all the advantages of networking your serial devices.

For easier management, the NPort W2150A-W4/W2250A-W4 Series includes features such as password authentication, IP filtering, 64-bit and 128-bit WEP encryption, and SNMP support.

Package Checklist

Standard Accessories

- 1 NPort W2150A-W4 or NPort W2250A-W4 wireless device server
- 1 antenna 2.4/5 GHz: ANT-WDB-ASM-03 BK
- 100 to 240 VAC power adapter (excluding T models)*
- 1 Ethernet cable: CBL-RJ458P-100
- Quick installation guide (printed)
- Warranty card

NOTE

The package includes one power adapter suitable for your region.

NOTE

The operating temperature of the power adapter (included with the NPort W2150A-W4/W2250A-W4) is from 0 to 40°C (32 to 104°F). If your application is not in this range, please use a power adapter supplied according to the requirements below:

- The external power source must comply with UL listed, IEC 60950-1, or IEC/EN 62368-1
- Output complies to SELV/ES1, PS2/LPS; output rating 12 to 48 VDC, 0.455 A minimum
- A minimum ambient temperature of 55°C or 75°C. (55°C for the NPort W2150A-W4 and NPort W2250A-W4; 75°C for the NPort W2150A-W4-T and NPort W2250A-W4-T)

Optional Accessories

- DK35A: DIN-rail mounting kit (35 mm)
- Power-jack-to-terminal-block 12 cable (P/N: 919900000900)

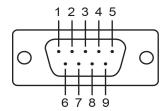

NOTE

Please notify your sales representative if any of the above items is missing or damaged.

Product Features

- Links serial and Ethernet devices to an IEEE 802.11a/b/g/n network
- Web-based configuration using built-in Ethernet or WLAN
- Secure boot for Moxa only authorized firmware allowed to run
- Remote configuration with HTTPS (TLS 1.3), SSH
- Secure data access with WEP, WPA, WPA2
- WPA/WPA2 Enterprise IEEE 802.1X/RADIUS (EAP-TLS 1.3)
- Fast roaming for quick automatic switching between access points
- Enhanced surge protection for serial, LAN, and power
- Offline port buffering and serial data log
- Dual power inputs (1 screw-type power jack, 1 terminal block)

Serial Port Pin Assignments

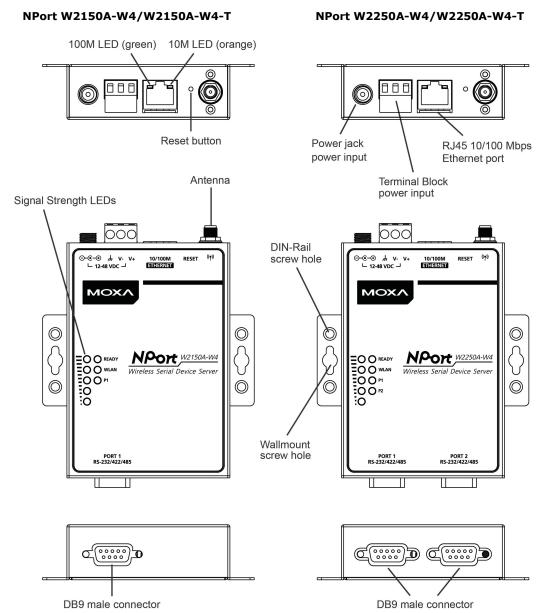

Pin	RS-232	RS-422/ RS-485 (4W)	RS-485 (2W)

6	DSR	-	-
7	RTS	_	-
8	CTS	-	-
9	-	-	-

2. Getting Started

Overview

This chapter presents the hardware features of the NPort W2150-W4/W2250A-W4 Series and explains how to connect the hardware.

Panel Layout

LED Indicators

Top Panel LED Indicators

Name	Color	Function		
		Steady on: Power is on, and the NPort is booting up.		
	Red	Blinking: An IP conflict exists, or the DHCP server did not respond		
D		properly.		
Ready	Green	Steady on: The NPort is functioning normally.		
		Blinking: The unit is responding to Locate function.		
	Off	Power is off, or a power error condition exists.		
		Steady on: Wireless enabled		
WLAN	Green	Blinking: The NPort can't establish WLAN connection with AP		
VVLAIV		(Infrastructure)		
	Off	Wireless not enabled.		
Port 1	Orange	Serial port is receiving data.		
Port 2	Green	Serial port is transmitting data.		
10102	Off	No data is flowing to or from the serial port.		
	Red	1 Red - the signal strength (RSSI) is worse than -88 dBm		
Signal Strength	Reu	2 Red - the signal strength (RSSI) is between -87 to -79 dBm		
(5 LEDS)	Green	3 Green - the signal strength (RSSI) is between -78 to -68 dBm		
(3 LLD3)		4 Green - the signal strength (RSSI) is between -67 to -60 dBm		
		5 Green - the signal strength (RSSI) is between -59 to -45 dBm		

End Panel LED Indicators

Name Color		Function
	Orange	10 Mbps Ethernet connection
Ethernet	Green	100 Mbps Ethernet connection
	Off	Ethernet cable is disconnected

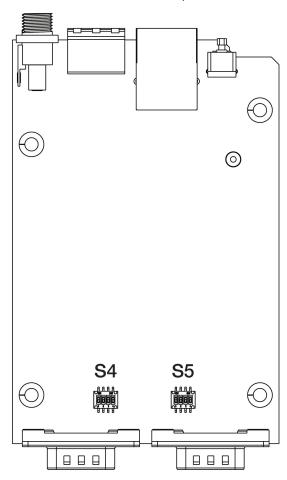

Pull High/Low Resistors for RS-422/485

You may need to set the pull high/low resistors when termination resistors are used for certain RS-422 or RS-485 environments.

S4 (Port 1)	DIP 1	DIP 2	DIP 3	DIP 4
S5 (Port 2)	Pull high resistor	Pull low resistor	Termination resistor	Reserved
ON	1 ΚΩ	1 ΚΩ	120 Ω	-
OFF	*150 KΩ	*150 KΩ	*N/A	-

^{*}Default

S5 is for NPort W2250A-W4 only

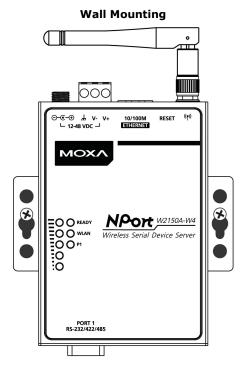

ATTENTION

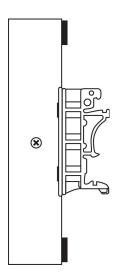

Do not use the 1 $\rm K\Omega$ setting while in RS-232 mode. Doing so will degrade the RS-232 signals and reduce the effective communication distance.

Placement Options

The NPort can be placed on a desktop or other horizontal surface. You can also install the NPort on a DIN-rail or on the wall.

DIN-Rail Mounting

Connecting the Hardware

ATTENTION

Before connecting the hardware, follow these important wiring safety precautions:

Disconnect power source

Do not install or wire this unit or any attached devices with the power connected. Disconnect the power before installation by removing the power cord before installing and/or wiring your unit.

Follow maximum current ratings

Calculate the maximum possible current in each power wire and common wire. Observe all electrical codes dictating the maximum current allowable for each wire size.

If the current goes above the maximum ratings, the wiring could overheat, causing serious damage to your equipment.

Use caution - unit may get hot

The unit will generate heat during operation, and the casing may be too hot to touch. Take care when handling the unit. Be sure to leave adequate space for ventilation.

The following guidelines will help ensure trouble-free signal communication with the NPort.

- Use separate paths to route wiring for power and devices to avoid interference. Do not run signal or communication wiring and power wiring in the same wire conduit. The rule of thumb is that wiring that shares similar electrical characteristics can be bundled together.
- If power wiring and device wiring paths must cross, make sure the wires are perpendicular at the intersection point.
- Keep input wiring and output wiring separately.
- Label all wiring to each device in the system for easier testing and troubleshooting

Connecting to the Network

Use the supplied Ethernet cable to connect the NPort to your Ethernet network. If the cable is properly connected, the NPort will indicate a valid connection to the Ethernet as follows:

- A green Ethernet LED indicates a valid connection to a 100 Mbps Ethernet network.
- An orange Ethernet LED indicates a valid connection to a 10 Mbps Ethernet network.
- A flashing Ethernet LED indicates that Ethernet packets are being transmitted or received.

Connecting the Power

Connect the VDC power line (12 to 48 V) to the NPort's power jack or terminal block (recommended for only one connection at a time). If power is properly connected, the "Ready" LED will initially glow red. When the system is ready, the "Ready" LED will turn green.

Connecting to a Serial Device

Use a serial cable to connect your serial device to a serial port on the NPort.

3. Initial IP Configuration

Overview

This chapter presents several ways to assign the NPort's IP address for the first time. Please refer to Chapter 2 for instructions on connecting to the network.

The web console is the recommended method for configuring the NPort. Please refer to Chapter 5 and 6 for details on using the web console for configuration.

ATTENTION

The LAN and WLAN interfaces cannot be used at the same time if you don't enable the Ethernet Bridge mode (please refer to Chapter 7 for more details). If the Ethernet link is active, then WLAN connections will be disabled. If the WLAN connection is active, then the Ethernet link will be disabled.

ATTENTION

Make sure that the Ethernet cable is connected before powering up the NPort.

Factory Default IP Settings

Network Interface	IP Configuration	IP Address	Netmask
LAN	Static	192.168.126.254	255.255.255.0
WLAN	Static	192.168.127.254	255.255.255.0

If your NPort is configured to get its IP settings from a DHCP server but cannot get a response, it will use the factory default IP address and netmask.

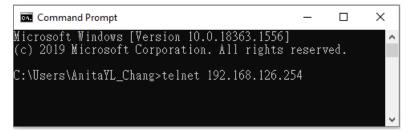

ATTENTION

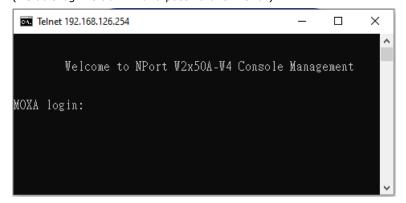

If you forget the IP address of your NPort, you can look it up using the Device Search Utility (DSU). After the Device Search Utility (DSU) has found all NPorts on the network, each unit will be listed with its IP address. Please refer to Chapter 11 for additional information on using the Device Search Utility (DSU).

Using the Telnet Console to an Assign IP Address

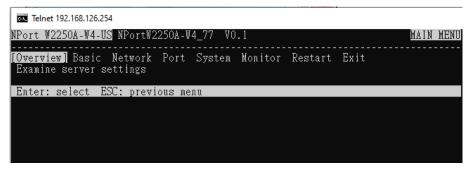

- 1. Select **Command Prompt...** from the Windows Start menu.
- 2. Enter telnet 192.168.126.254 (the NPort's default IP address) and click [OK].

3. Enter your login account and password, then press **ENTER.** (Default login is **admin** and password is **moxa**.)

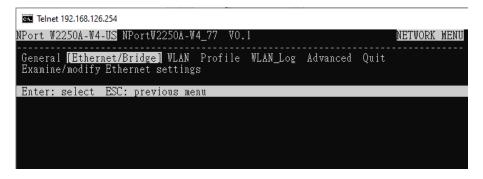

4. You will login to the **Overview** page.

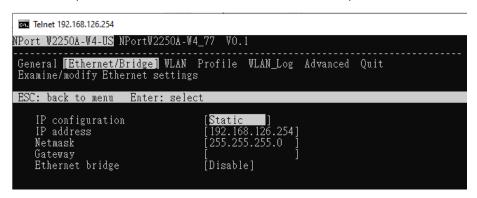

5. Press **N** or use the cursor keys to select **Network** and press **ENTER**.

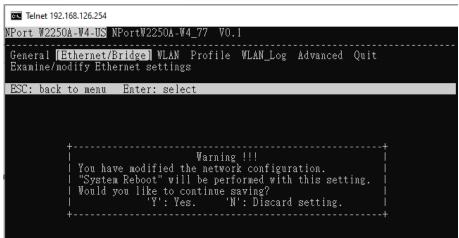

6. Press **E** or use the cursor keys to select **Ethernet** and press **ENTER**.

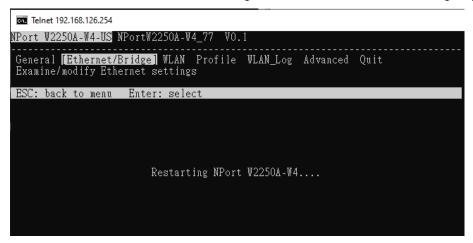

7. Use the cursor keys to navigate between the different fields. For **IP address**, **Netmask**, and **Gateway**, enter the desired values directly. For **IP configuration**, **LAN speed**, and **Ethernet bridge**, press **ENTER** to open a submenu and select between the available options.

8. Press ESC to return to the menu. When prompted, press Y to save the configuration changes.

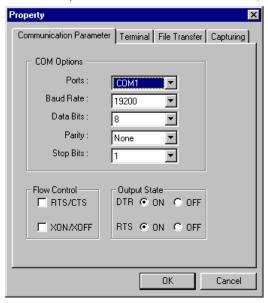

The NPort will reboot with the new IP settings. You can telnet to the new IP to login again.

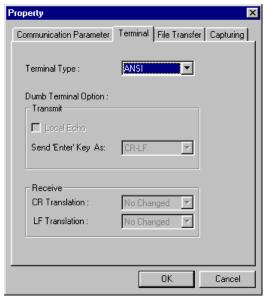

Using the Serial Console to an Assign IP Address

Before using the NPort's serial console, turn off the power and use a serial cable to connect the NPort console port to your computer's serial port. Port 1 on the NPort serves as the console port. Use Port 1 connecting to the console port with a serial-based terminal or terminal emulator program, such as Windows HyperTerminal. You may also download PComm Lite at www.moxa.com. The terminal type should be set as ANSI or VT100, and the serial communication parameters should be set as 19200, 8, N, 1 (19200 for baud rate, 8 for data bits, None for parity, and 1 for stop bits). As soon as the connection is open, you will be presented with a text menu displaying the NPort W2150A-W4/W2250A-W4 Series general settings. Please refer to Chapter 4 for a description of the available settings. The following instructions, we recommend using PComm Terminal Emulator, which can be downloaded free from www.moxa.com, to carry out the configuration procedure.

- 1. Connect your PC's serial port to the NPort's console port.
- 2. Open your terminal emulator program, such as Windows HyperTerminal. We recommend using PComm Terminal Emulator, which can be downloaded for free at www.moxa.com.
- 3. In your terminal emulator program, configure the communication parameters for the serial port on the PC. Set the parameters to **19200** for baudrate, **8** for data bits, **None** for parity, and **1** for stop bits.

4. In your terminal emulator program, set the terminal type to **ANSI** or **VT100**. If you select **Dumb Terminal** as the terminal type, some of the console functions—especially the "Monitor" function—may not work properly.

5. Hold the **grave accent** key (`) down and power up the NPort.

The continuous string of grave accent characters triggers the NPort to switch from data mode to console mode.

6. The serial console will open and will be functionally identical to the Telnet console. Please refer to the Telnet console section for instructions on how to navigate the console and configure the IP settings.

4. Introduction to Operation Modes

Overview

This chapter introduces the different serial port operation modes that are available on the NPort W2150A-W4/W2250A-W4 Series. Each serial port on the NPort is configured independently of the other ports, with its own serial communication parameters and operation mode. The serial port's operation mode determines how it interacts with the network, and different modes are available to encompass a wide variety of applications and devices.

Real COM and **RFC2217** modes allow serial-based software to access the NPort serial port as if it were a local serial port on a PC. These modes are appropriate when your application relies on Windows or Linux software that was originally designed for locally attached COM or TTY devices. With these modes, you can access your devices from the network using your existing COM/TTY-based software, without investing in additional software.

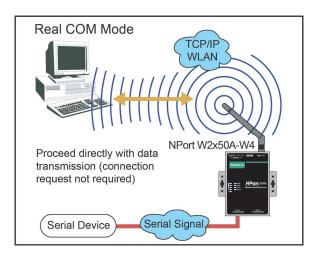

Three different socket modes are available for user-developed socket programs: **TCP Server**, **TCP Client**, and **UDP Server/Client**. For TCP applications, the appropriate mode depends on whether the connection will be hosted or started from the NPort serial port or from the network. The major difference between the TCP and UDP protocols is that TCP guarantees delivery of data by requiring the recipient to send an acknowledgement to the sender. UDP does not require this type of verification, making it possible to offer speedier delivery. UDP also allows multicasting of data to groups of IP addresses and would be suitable for streaming media or noncritical messaging applications, such as LED message boards.

Pair Connection Slave and **Master** modes are designed for serial-to-serial communication over Ethernet, in order to overcome traditional limitations with serial transmission distance.

In **Ethernet Modem** mode, the NPort acts as an Ethernet modem, providing a network connection to a host through the serial port.

Real COM Mode

Real COM mode works with NPort drivers that are installed on a network host. COM drivers are provided for Windows systems, and TTY drivers are provided for Linux and UNIX systems. The driver establishes a transparent connection to the attached serial device by mapping a local serial port to the NPort serial port. Real COM mode supports up to four simultaneous connections, so multiple hosts can collect data from the attached device at the same time.

ATTENTION

Real COM drivers are installed and configured through NPort Windows Driver Manager.

Real COM mode allows you to continue using your serial communications software to access devices that are now attached to your NPort device server. On the host, the NPort Real COM driver automatically intercepts data sent to the COM port, packs it into a TCP/IP packet, and redirects it to the network. At the other end of the connection, the NPort device server accepts the Ethernet frame, unpacks the TCP/IP packet, and sends the serial data to the appropriate device.

ATTENTION

In Real COM mode, several hosts can have simultaneous access control over the NPort serial port. If necessary, you can limit access by using the NPort's Accessible IP settings. Please refer to Chapter 8 for additional information on Accessible IP settings.

RFC2217 Mode

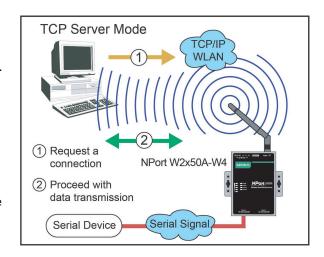

RFC-2217 mode is similar to Real COM mode, since it relies on a driver to transparently map a virtual COM port on a host computer to a serial port on the NPort. The RFC2217 standard defines general COM port control options based on the Telnet protocol and supports one connection at a time. Third party drivers supporting RFC-2217 are widely available on the Internet and can implement virtual COM mapping.

TCP Server Mode

In TCP Server mode, the NPort serial port is assigned an IP:port address that is unique on your TCP/IP network. It waits for the host computer to establish a connection to the attached serial device. This operation mode also supports up to eight simultaneous connections, so multiple hosts can collect data from the attached device at the same time.

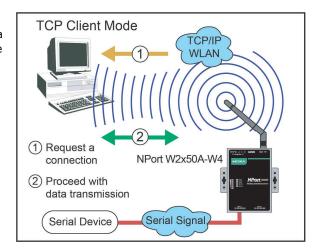

Data transmission proceeds as follows: A host requests a connection to the NPort serial port.

Once the connection is established, data can be transmitted in both directions—from the host to the device, and from the device to the host.

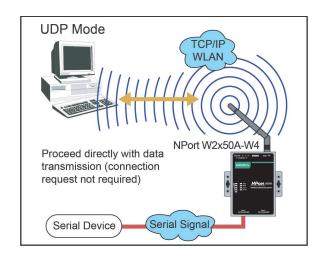

TCP Client Mode

In TCP Client mode, the NPort actively establishes a TCP connection to a specific network host when data is received from the attached serial device. After the data has been transferred, the NPort can automatically disconnect from the host computer through the Inactivity time settings. Please refer to Chapter 7 for details on these parameters. Data transmission proceeds as follows: The NPort requests a connection from the host. The connection is established and data can be transmitted in both directions between the host and device.

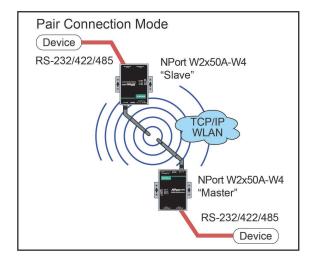

UDP Mode

UDP is similar to TCP but is faster and more efficient. Data can be broadcast to or received from multiple network hosts. However, UDP does not support verification of data and would not be suitable for applications where data integrity is critical. It is ideal for message display applications.

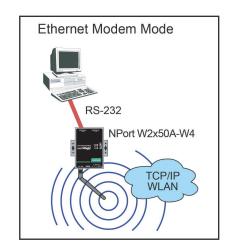

Pair Connection Modes

Pair Connection Master and Slave modes connect two NPort device servers over a network for serial-to-serial communication. A device attached to one NPort can then communicate transparently to a device attached to the other NPort, as if a serial cable connected the two devices. Both data and modem control signals are exchanged, except for DCD signals. This can overcome traditional limitations with serial communication distance and introduce many new possibilities for serial-based device control.

Ethernet Modem Mode

Ethernet Modem mode is designed for use with legacy operating systems, such as MS-DOS, that do not support TCP/IP Ethernet. By connecting the properly configured NPort serial port to the MS-DOS computer's serial port, it is possible to use legacy software to transmit data over the Ethernet when the software was originally designed to transmit data over a modem.

Reverse Terminal Mode

Reverse terminal applications are similar to terminal applications, as they use the NPort W2x50A-W4 to manage the connection between a terminal and a server. The difference is that with reverse terminal applications; the terminal is connected through the network and the server is connected through the serial port, rather than the other way around. In practice, a reverse terminal session typically involves a network administrator telnetting to a device that has a dedicated serial console port used specifically for configuration.

For example, many routers, switches, UPS units, and other devices (including the NPort W2x50A-W4) have Console/AUX or COM ports to which a terminal can be physically connected for console management. With the NPort W2x50A-W4, the device's console port can be connected to a serial port on the NPort W2x50A-W4, allowing a network administrator to telnet to the device remotely through the network. Although modern network equipment allows other options for remote configuration through the network, there are situations in which it is necessary or desirable to configure a device by serial console (e.g., for security reasons, when using older-generation equipment, or as a backup configuration method when the network is down).

NPort W2x50A-W4 reverse terminal modes allow the use of the NPort W2x50A-W4 User Table or a RADIUS server for identity verification purposes.

5. Installing and Configuring the Software

Overview

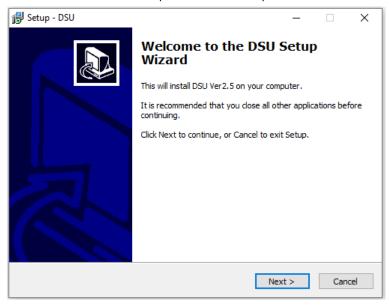

This chapter describes how to install and use the NPort Windows Driver Manager, the Device Search Utility (DSU), and NPort Linux and UNIX drivers. You may download these items from Moxa's website that is provided with the NPort W2150A-W4/W2250A-W4 Series.

NPort Windows Driver Manager is a utility that installs and manages NPort COM drivers for COM mapping. The **Device Search Utility (DSU)** is a utility for the management of NPort device servers over the network. You may also use the Device Search Utility (DSU) to upgrade the firmware.

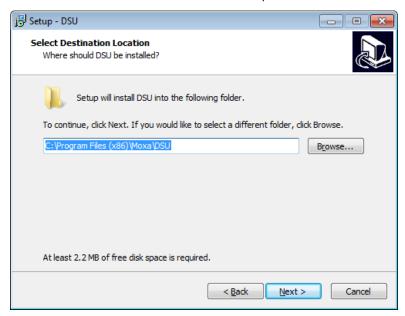

Device Search Utility (DSU)

Installing the DSU

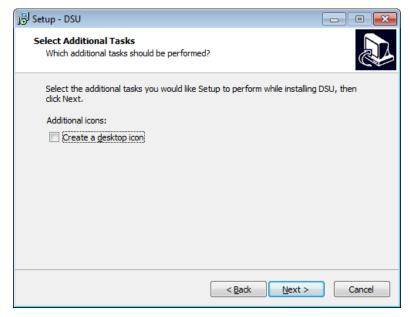

- Download the DSU from Moxa's website: https://www.moxa.com/support/download.aspx?type=support&id=10137
 You may double click on the executable file. Once the program runs, click **Yes** to proceed.
- 2. The installation wizard will open. Click **Next** to proceed.

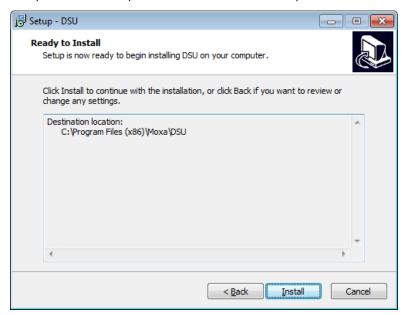

3. Select a destination location and click **Next** to proceed.

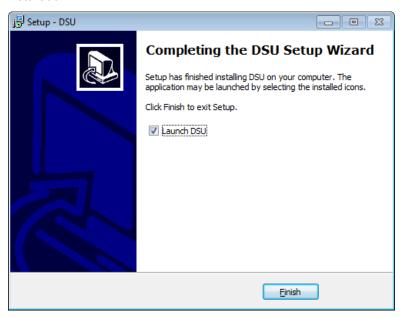

4. Show if you wish to create a desktop icon and click Next to proceed.

5. Verify the installation parameters and click Install to proceed.

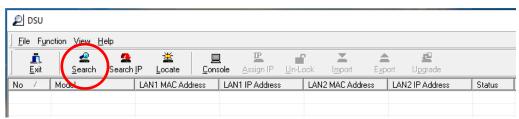

6. The wizard will begin installing the files. After the files have been installed, click **Finish** to complete the installation.

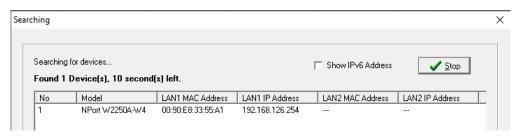

Finding NPort Device Servers on a Network

You can use the Device Search Utility (DSU) to look up or change the IP address of any NPort device server on the network. Since the utility searches for devices based on their MAC address rather than IP address, all NPort units that are connected to the LAN will be located, regardless of whether they are part of the same subnet as the host.

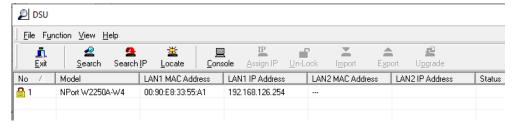

1. In the Device Search Utility (DSU), click **Search** on the main toolbar.

2. The utility will search for NPort device servers.

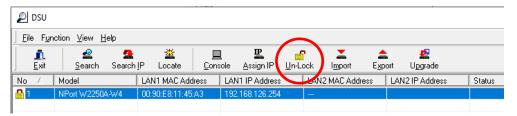

3. When the search is complete, the NPort units that were found will be listed in the main window.

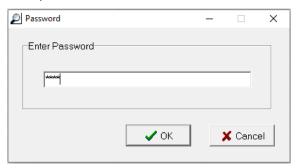

Unlock Device Servers

1. Select the device and click Un-Lock.

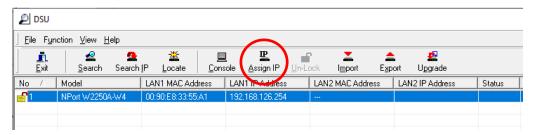

2. Enter password and click OK.

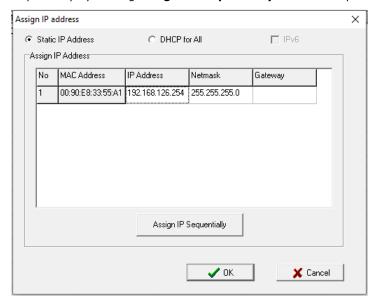

Modifying NPort IP Addresses

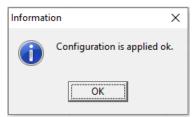

1. Once the Device Search Utility (DSU) has found NPort device servers on the LAN, you can change any unit's IP address. Select the desired NPort in the main window and click **Assign IP** on the main toolbar. This will change the IP address for the active network connection (LAN or WLAN).

2. Enter the new IP address and netmask. If multiple units were selected, you may assign addresses sequentially by clicking **Assign IP Sequentially**. Click **OK** to proceed.

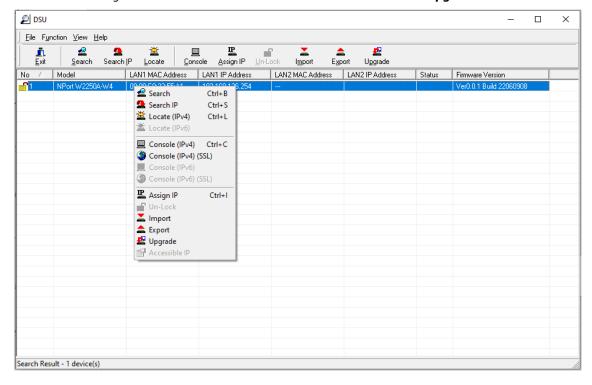

3. The selected NPort will be restarted by the Device Search Utility (DSU) with the new IP address.

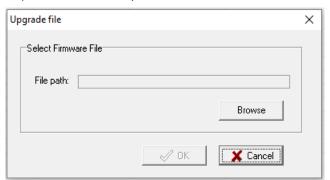

Upgrading NPort Firmware

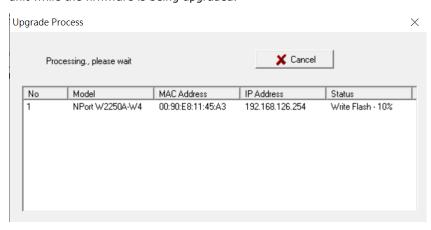

1. Once the Device Search Utility (DSU) has found NPort device servers on the LAN, you can upgrade any unit's firmware. Right-click the desired NPort in the main window and select **Upgrade**.

 Select the new firmware file and click **OK** to proceed. To get the latest firmware for the NPort W2150A-W4/W2250A-W4 Series, visit www.moxa.com.

3. The utility will begin upgrading the firmware for the selected unit. Do not disconnect or power off the unit while the firmware is being upgraded.

4. When the displayed status is OK, click **Close** to complete the process.

ATTENTION

The Device Search Utility (DSU) supports upgrading the firmware of multiple units simultaneously if each unit is the same model. Hold down the CTRL key to add additional units to your selection; hold down the SHIFT key to select a block of units.

NPort Windows Driver Manager

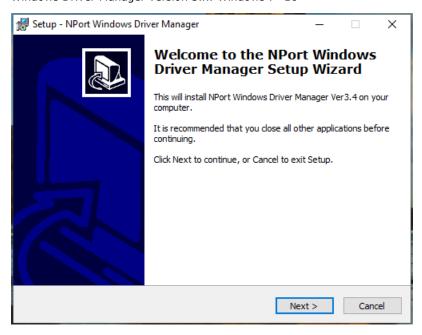

NPort Windows Driver Manager installs remote NPort serial ports as new COM ports on your Windows PC. When the drivers are installed and configured, devices that are attached to serial ports on the NPort will be treated as if they were attached to your PC's own COM ports. The NPort serial port must be configured for Real COM mode when being mapped to a COM port.

Installing NPort Windows Driver Manager

 Download the NPort Windows Driver Manager from Moxa website: https://www.moxa.com/support/download.aspx?type=support&id=974

You may double click on the executable file. Once the installation program runs, click [Yes] to proceed.

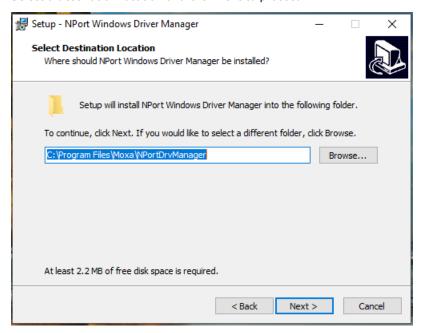

The installation wizard will open. Click **Next** to proceed.
 Windows Driver Manager version 4.0: Windows 11/server 2022
 Windows Driver Manager version 3.x: Windows 7~10

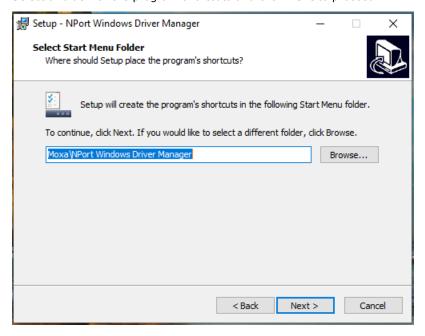

3. Read and select I accept the agreement. Click Next to proceed.

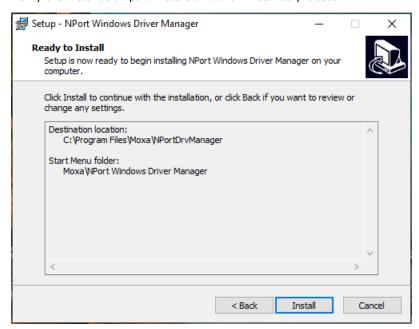

4. Select a destination location and click Next to proceed.

5. Select a folder for the program shortcuts and click **Next** to proceed.

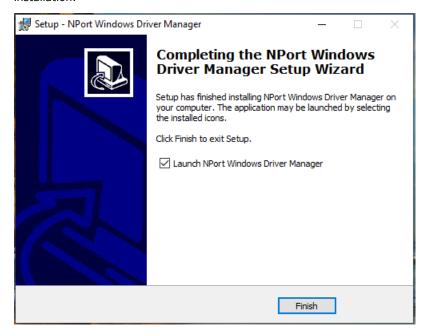

6. Verify the installation parameters and click Install to proceed.

7. If you see a warning that the software has not passed Windows Logo testing, click **Continue Anyway** to proceed.

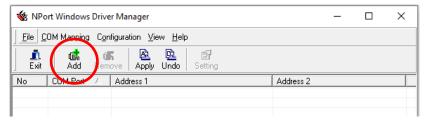

8. The wizard will begin installing the files. When the files have been installed, click **Finish** to complete the installation.

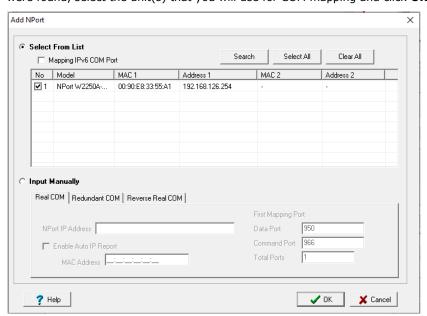

Adding Mapped Serial Ports

NPort Windows Driver Manager adds a COM port to your PC that is mapped to an NPort serial port. The destination NPort serial port must be set to Real COM mode.

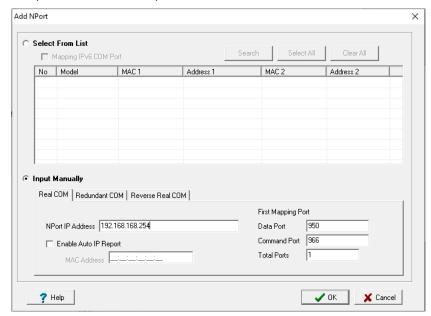

1. In NPort Windows Driver Manager, click Add on the main toolbar.

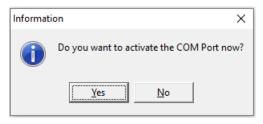

2. Click **Search** to search the network for NPort device servers. In the list of NPort device servers that were found, select the unit(s) that you will use for COM mapping and click **OK**.

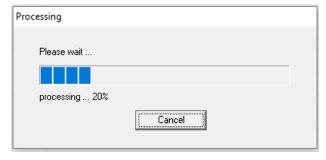

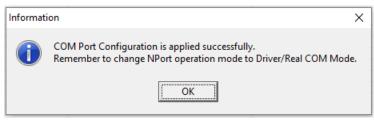

3. Alternatively, you can select **Input Manually** and manually enter the **NPort IP Address**, **1st Data Port**, **1st Command Port**, and **Total Ports** for the desired NPort unit. Click **OK** to proceed.

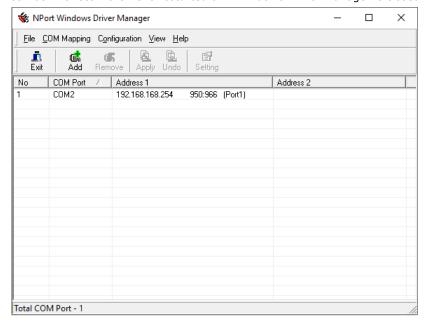

4. NPort Windows Driver Manager will list each available serial port and will automatically assign a new COM port to each one. The new COM port will not be accessible by the host system until it has been activated in NPort Windows Driver Manager. Activating a mapped COM port saves the information in the host system registry and makes the COM port available for use. Click **Yes** to activate the COM port(s); click **No** to activate the COM port(s) later.

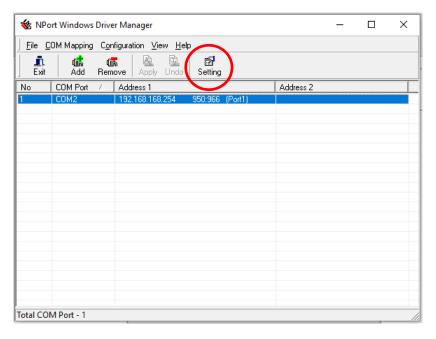

5. Activated COM ports will be listed in black; COM ports that have not been activated will be listed in blue. Once a COM port has been activated, the host computer will communicate with the new COM port as if it were physically attached. Since the COM mappings are stored in the host system registry, they will still be in effect if the PC is restarted or if Windows Driver Manager is closed.

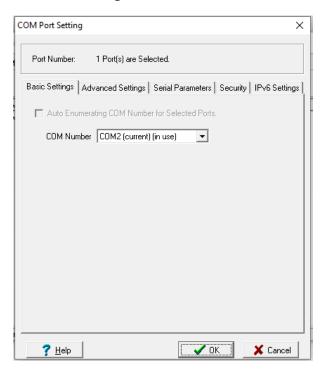

Configuring Mapped Serial Ports

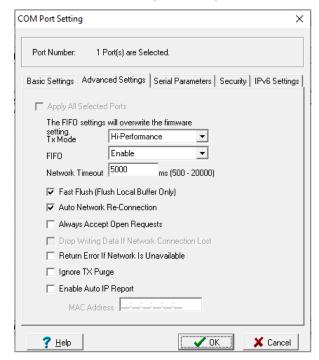

1. To change the settings of a mapped serial port, select the desired port(s) and click **Setting** on the main toolbar.

2. On the **Basic Setting** tab, select the **COM Number** that will be assigned to the serial port. If you have selected multiple ports, you can assign COM numbers automatically in sequential order by selecting the **Auto Enumerating COM Number for Selected Ports** function.

3. On the **Advanced Setting** tab, configure **Tx Mode**, **FIFO**, and **Fast Flush**.

Tx Mode: In Hi-Performance mode, the driver immediately issues a "Tx Empty" response to the program after sending data to the NPort. In Classical mode, the driver sends the "Tx Empty" response after confirmation is received from the NPort. Classical mode is recommended if you want to ensure that all data is sent out before further processing.

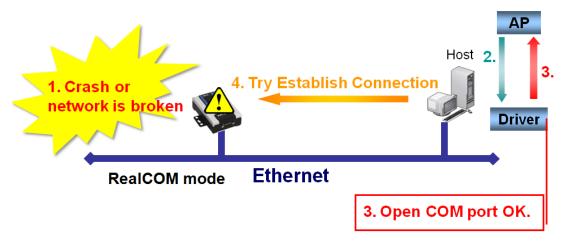

FIFO: This tells the driver whether or not to use the FIFO.

Network Timeout: You can use this option to prevent blocking if the target NPort is unavailable.

Fast Flush: When enabled, the driver flushes only the local buffer on the host for a Win32 PurgeComm() function call. When disabled, both the local and remote buffers are flushed. If your application uses PurgeComm() and performance seems sluggish, try enabling Fast Flush.

Auto Network Re-Connection: With this option enabled, the driver will repeatedly attempt to reestablish the TCP connection if the NPort does not respond to background "check-alive" packets

Always Accept Open Requests: When enabled, the NPort driver will always accept requests to open a virtual COM port, even if communications with the device can not be established. With this option, the NPort driver will open a virtual COM port on the system even if the port is blocked or the Ethernet connection is disabled. If this is the case, the connected device will not receive and transmit data even though the system has opened a virtual COM port.

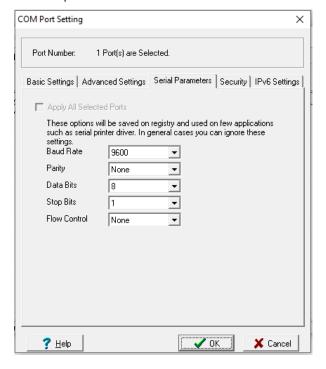

Drop Writing Data if Network Connection is Lost: This function will assure the data to be kept in the buffer or dropped when network connection is lost. The buffer size is 4 KBytes.

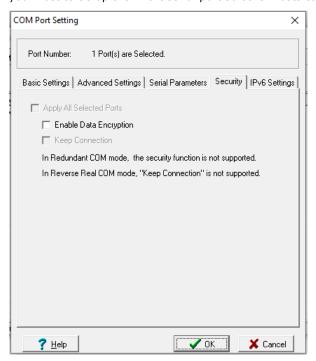

Return error if network is unavailable: If this option is disabled, the driver will not return any error even when a connection cannot be established to the NPort. With this option enabled, calling the Win32 Comm function will cause the error return code "STATUS_NETWORK_UNREACHABLE" when a connection cannot be established to the NPort. This usually means that your host's network connection is down, perhaps because of a cable being disconnected. However, if you can reach other network devices, maybe the NPort is not powered on or is disconnected. Not that **Auto Network Re-Connection** must be enabled in order to use this function.

Ignore TX Purge: Applications can use the Win32 API PurgeComm to clear the output buffer. Outstanding overlapping write operations will be terminated. Select the **Ignore TX Purge** checkbox to ignore the effect on output data.

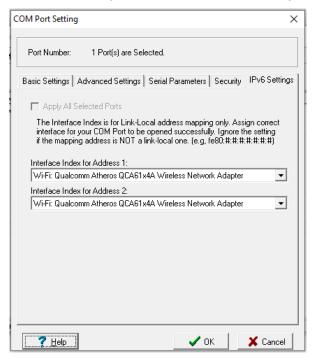

4. On the **Serial Parameters** tab, specify the communication settings that the host will use when opening the COM port.

5. (NPort 6000 models only) On the **Security** tab, select the **Enable Data Encryption** option to enable data to be encrypted when transmitted over the COM ports. After selecting the encryption option, select the **Keep connection** option to encrypt COM port communications immediately without restarting the COM ports. This may speed up opening and closing of the COM port for your host, but it also causes your host to tie up the NPort serial port so other hosts cannot use it.

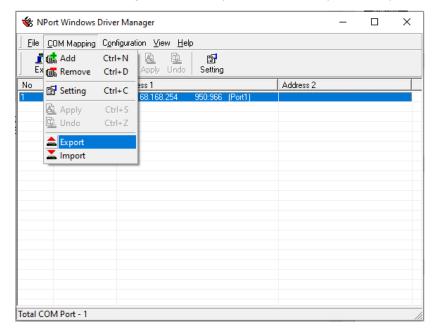

6. On the IPv6 Setting tab, interface 1 and 2 can change.

7. Click **OK** when you have finished configuring the COM port.

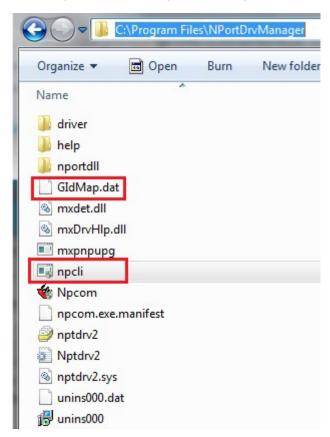

8. To save all COM mapping settings to a text file, right-click a COM port and select **Export** in the context menu. After the settings have been exported to a file, they can be imported on another host.

Command-Line Installation/Removal

For NPort Windows Driver Manager v1.19 and above, it comes with command line script tool—npcli.exe for installation, removal of the driver and capability of configuring NPort driver functions.

After successfully installing NPort Windows Driver Manager v1.19 (or above), the default file path is C:\Program Files\NPortDrvManager as shown below. The main files that support the NPort command line tool are npcli.exe and GIdMap.dat. You may move these two files to your preferred location.

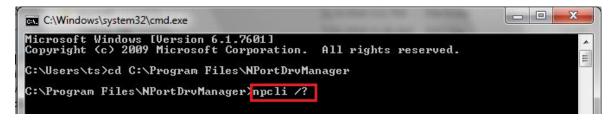

Once NPort Windows Driver Manager v1.19 (or above) is installed, call up the cmd screen on your computer. Change the directory to the drive where you placed the above two files.

```
C:\Windows\system32\cmd.exe

Microsoft Windows [Version 6.1.7601]
Copyright (c) 2009 Microsoft Corporation. All rights reserved.

C:\Users\ts>cd C:\Program Files\NPortDrvManager
```

Type npcli /? to get detailed information of what command lines are supported and the function descriptions.

The usage instructions will show up for a user's reference.

```
NPort Command Line Interface Ver2.0 Build 16052400
sage:
 1. NPort Driver operation:
   npcli /driver [/install | /uninstall | /upgrade] [PATH_NAME]
 /install
                Install specified driver to host.
               Uninstall current installed driver from host.
 /uninstall
 /upgrade
                Upgrade specified driver without modifying the mapped ports.
 PATH NAME
                Specify the installer file of the NPort Driver Manager to install
                or upgrade.
 2. RealCOM port operation:
   npcli /driver /add IP ADDR /port PORT NO /com COM NO [/txmode [hiperf |
         classical]] [/fifo [enable | disable]] [/flush [fast | normal]]
   npcli /driver /remove /com [COM_NO | all]
                Add a RealCOM with a valid IP address (IP ADDR).
  /add
  /port
                Specify the NPort port number (PORT NO) to add.
                Specify the COM number to add or remove (COM NO).
               Set the TX mode as hi-performance (hiperf) or classical. The
 /txmode
                default is hiperf.
 /fifo
                Set the FIFO as enable or disable. The default is enable.
  /flush
                Set to enable fast flush(fast) or disable fast flush(normal).
                The default is fast.
  /remove
                Remove specified COM number (COM NO) or all RealCOM ports.
 3. NPort devices operation:
   npcli /devicd /search
   npcli /device /set ID /network [/ip IP ADDR] [/mask SUBNET]
          [/gateway IP ADDR] [/password CIPHER]
   npcli /device /apply ID [/password CIPHER]
                Search the NPort and store the list to the memory.
  /search
  /set
                Specify the ID to set. Users must specify one of the searched
```

```
NPorts for further operations. The default is 1.
  /port
                Specify the NPort port number (PORT_NO) to set.
  /password
                Specify the password (CIPHER) if the NPort has one.
  /network
                Set to change the network settings.
                Change the IP address (IP ADDR) of NPort.
                Change the subnet mask (SUBNET) of NPort.
  /mask
  /gateway
                Change the IP address (IP ADDR) of gateway.
                Specify the ID to save changes and restart the NPort.
  /apply
  4. Examples
    npcli /driver /install D:\Users\drvmgr setup Ver1.19.0 Build 15122492
    npcli /driver /uninstall
    npcli /driver /add 192.168.127.254 /port 1 /com 3
   npcli /driver /add 192.168.127.254 /port 2 /com 4 /flush normal
   npcli /device /search
   npcli /device /set 1 /network /ip 192.168.10.7 /mask 255.255.255.0
          /password moxa
   npcli /device /apply 1
Note:
  Npcli.exe requires an administrator privilege to change device settings.
  It support only IPv4 and it must be run under Windows XP and later versions.
```

Linux Real TTY Drivers

Real TTY driver is provided that will map Linux host TTY ports to NPort serial ports. Once the mapping has been set up, Linux users and applications can connect to a serial port as if it were a local TTY port. These drivers have been designed and tested for most Linux distributions, including Linux kernel version 2.4.x, 2.6.x, and 3.x, 4.x. Please check http://www.moxa.com for the latest Linux kernel supported.

Basic Steps

Follow these instructions to map a TTY port to an NPort serial port:

- 1. Install the NPort device server and set the target device port to Real COM mode.
- 2. Install the Real TTY driver files on the Linux host.
- 3. Map the host's TTY port to the target device port on the NPort.

Installing Linux Real TTY Driver Files

Before proceeding with the software installation, make sure you have completed the NPort device server has been installed and configured correctly. Note that the default LAN IP address for the NPort is **192.168.126.254**, whereas the default WLAN IP address is **192.168.127.254**.

ATTENTION

The target serial port must operate in Real COM mode in order to map TTY ports.

- 1. Get the driver file from https://www.moxa.com/support/support-home.aspx?isSearchShow=1.
- 2. Log in to the console as a super user (root).
- 3. Execute **cd /** to go to the root directory.
- 4. Copy the driver file **npreal2xx.tgz** to the / directory.
- 5. Execute **tar xvfz npreal2xx.tgz** to extract all files into the system.
- Execute /tmp/moxa/mxinst. (For Red Hat AS/ES/WS and Fedora Core1, execute "# /tmp/moxa/mxinst SP1".) The shell script will install the driver files automatically.

7. After installing the driver, you will see several files in the /usr/lib/npreal2/driver folder:

mxaddsvr (add server, map TTY port)
mxdelsvr (delete server, undo TTY port mapping)
mxloadsvr (reload server)
mxmknod (create device node/TTY port)
mxrmnod (remove device node/TTY port)
mxuninst (remove TTYport and

Enter the new IP address and netmask. If multiple units were selected, you may Mapping TTY Ports

Make sure that you set the operation mode of the desired NPort serial port to Real COM mode. After logging in as a super user, enter the directory /usr/lib/npreal2/driver and then execute mxaddsvr to map the target NPort serial port to the host TTY ports. The syntax of mxaddsvr is as follows:

mxaddsvr [NPort IP Address] [Total Ports] ([Data port] [Cmd port])

The **mxaddsvr** command performs the following actions:

- 1. Change npreal2d.cf.
- 2. Create TTY ports in directory /dev with major and minor number configured in npreal2d.cf.
- 3. Restart the driver.

Mapping TTY ports automatically

To map TTY ports automatically, you may execute **mxaddsvr** with just the IP address and number of ports, as in the following example:

```
# cd /usr/lib/npreal2/driver
# ./mxaddsvr 192.168.3.4 16
```

In this example, 16 TTY ports will be added, all with IP 192.168.3.4, with data ports from 950 to 965 and command ports from 966 to 981.

Mapping TTY ports manually

To map TTY ports manually, you may execute **mxaddsvr** and manually specify the data and command ports, as in the following example:

```
# cd /usr/lib/npreal2/driver
# ./mxaddsvr 192.168.3.4 16 4001 966
```

In this example, 16 TTY ports will be added, all with IP 192.168.3.4, with data ports from 4001 to 4016 and command ports from 966 to 981.

Removing Mapped TTY Ports

After logging in as root, enter the directory **/usr/lib/npreal2/driver** and then execute **mxdelsvr** to delete a server. The syntax of mxdelsvr is:

mxdelsvr [IP Address]

Example:

```
# cd /usr/lib/npreal2/driver
# ./mxdelsvr 192.168.3.4
```

The following actions are performed when executing **mxdelsvr**:

- 1. Change npreal2d.cf.
- 2. Remove the relevant TTY ports in directory /dev.
- 3. Restart the driver.

If the IP address is not provided in the command line, the program will list the installed servers and total ports on the screen. You will need to choose a server from the list for deletion.

Removing Linux Driver Files

A utility is included that will remove all driver files, mapped TTY ports, and unload the driver. Enter the directory /usr/lib/npreal2/driver and execute mxuninst to uninstall the driver. This program will perform the following actions:

- 1. Unload the driver.
- 2. Delete all files and directories in /usr/lib/npreal2.
- 3. Delete directory /usr/lib/npreal2.
- 4. Modify the system initializing script file.

UNIX Fixed TTY Drivers

A fixed TTY driver is provided that will map UNIX host TTY ports to NPort serial ports. Once the mapping has been set up, UNIX users and applications can connect to an NPort serial port as if it were a local TTY port. This driver has been designed and tested for most UNIX systems. Please check http://www.moxa.com for the latest UNIX systems support.

Installing the UNIX Driver

 Log in to UNIX and create a directory for the MOXA TTY. To create a directory named /usr/etc, execute the command:

```
# mkdir -p /usr/etc
```

Copy moxattyd.tar to the directory you created. For the /usr/etc directory, you would execute the following commands:

```
# cp moxattyd.tar /usr/etc
```

cd /usr/etc

3. Extract the source files from the tar file by executing the command:

tar xvf moxattyd.tar

The following files will be extracted:

```
README.TXT
moxattyd.c --- source code
moxattyd.cf --- an empty configuration file
Makefile --- makefile
VERSION.TXT --- fixed TTY driver version
FAQ.TXT
```

4. Compile and link.

For SCO UNIX:

make sco

For UnixWare 7:

make svr5

For UnixWare 2.1.x, SVR4.2:

make svr42

Configuring the UNIX Driver

Modify the configuration:

The configuration used by **moxattyd** is defined in the text file **moxattyd.cf**, which is in the same directory. You may use vi or any text editor to change the file, as follows:

ttyp1 192.168.1.1 950

You can refer to **moxattyd.cf** for detailed descriptions of the various configuration parameters. Please note that **Device Name** depends on the OS. See the Device Naming Rule section in README.TXT for more information.

To start the moxattyd daemon after system bootup, add an entry into **/etc/inittab** using the TTY name you defined in **moxattyd.cf**, as in the following example:

ts:2:respawn:/usr/etc/moxattyd/moxattyd -t 1

Device naming rule

For UnixWare 7, UnixWare 2.1.x, and SVR4.2, use:

pts/[n]

For all other UNIX operating systems, use:

ttyp[n]

The value of [n] should be equal or larger than 11 in order to prevent conflicts with the device names of functional keys in some UNIX systems.

Starting moxattyd

Execute the command init q or reboot your UNIX operating system.

Adding an additional server

Change the text file **moxattyd.cf** to add an additional server. Users may use vi or any text editor to change the file. For more configuration information, refer to **moxattyd.cf**, which contains detailed descriptions of the various configuration parameters.

Find the process ID (PID) of the moxattyd.

ps -ef | grep moxattyd

Update the configuration of moxattyd.

kill -USR1 [PID]

(e.g., if moxattyd PID = 404, kill -USR1 404)

This completes the process of adding an additional server.

6. Web Console: Basic Settings

Overview

This chapter introduces the NPort web console and explains how to configure the basic settings.

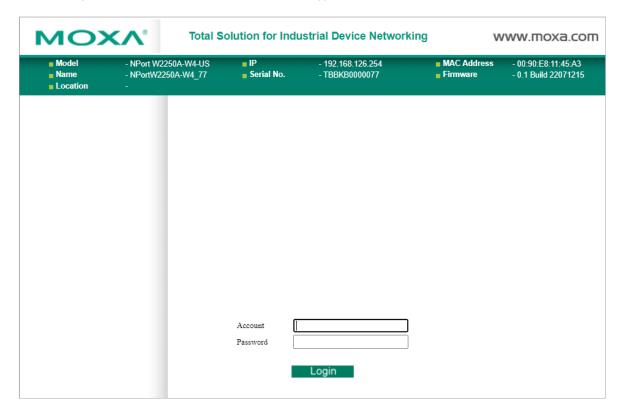

The NPort can be configured from anywhere on the network through its web console. Simply point the browser to the device server's IP address to open the web console. Network settings, operation mode, and other items can all be configured through the browser.

Navigating the Web Console

To open the web console, enter your device server's IP address in the website address line. If you are configuring the NPort for the first time over an Ethernet cable, you will use the default IP address, **192.168.126.254**.

There are two account types: **admin** and **user**. If you enter the system with **admin** account, you will have the right to read and write. If you enter the system with **user** account, you will only have the right to read.

If prompted, enter the console password. The default password for both **admin** and **user** accounts is **moxa**. The password will be transmitted with MD5 encryption over the Ethernet.

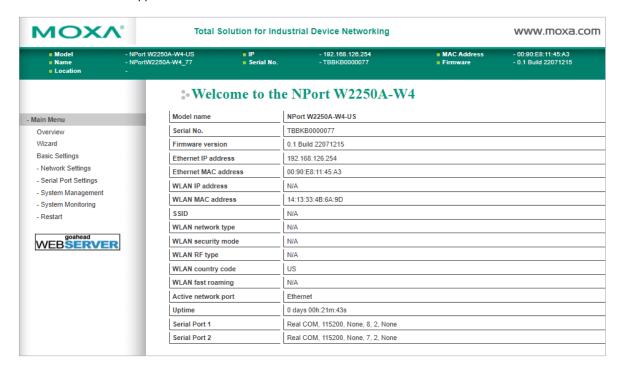

ATTENTION

If you have forgotten the password, you can use the reset button to load factory defaults, but this will erase all previous configuration information.

The web console will appear as shown below.

Settings are presented on pages that are organized by folder. Select the desired folder in the left navigation panel to open that page. The page will be displayed in the main window on the right. Certain folders can be expanded by clicking the adjacent "–" symbol.

For example, if you click **Basic Settings** in the navigation panel, the main window will show a page of basic settings that you can configure.

After you have made changes on a page, you must click **[Submit]** in the main window before jumping to another page. Your changes will be lost if you do not click **[Submit]**.

Once you click [Submit] button, the device server will reboot and with a beep alarm.

Basic Settings

On the Basic Settings page, you can configure Server name, Server location, Time zone (24-hour), Local time, and Time server.

Server Name

Default	NPortW2150A_ <serial no.=""> or NPortW2250A_<serial no.=""></serial></serial>
Options	free text (e.g., "Server 1")
Description	This is an optional free text field to help you differentiate one device server from another.
	It does not affect operation of the NPort device server.

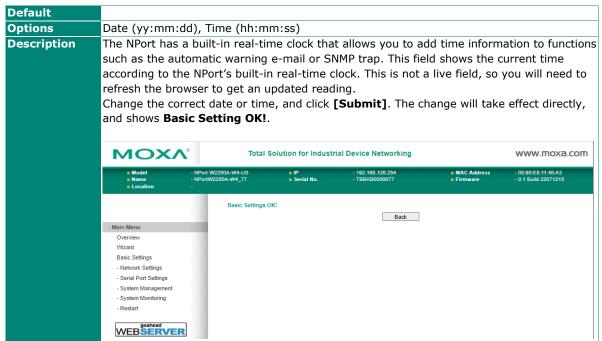

Server Location

Default	
Options	free text (e.g., "Bldg 1, 2nd Floor")
Description	This is an optional free text field to help you differentiate one device server from another.
	It does not affect operation of the NPort device server.

Time Zone

Default	(GMT)Greenwich Mean Time
Options	(GMT)Greenwich Mean Time
	(GMT-01:00)Azores, Cape Verde Is.
	(GMT-02:00)Mid-Atlantic etc.
Description	This field shows the currently selected time zone and allows you to select a different time
	zone.

Local Time

ATTENTION

There is a risk of an explosion if the real-time clock battery is replaced incorrectly!

The real-time clock is powered by a lithium battery. We strongly recommend that you get help from a Moxa support engineer before replacing the battery. Please contact the Moxa RMA service team if you need to change the battery.

Time Server

Default	
Options	IP address or domain name (e.g., "192.168.1.1" or "time.nist.gov")
Description	This optional field specifies your time server's IP address or domain name, if a time server
	is used in your network. The NPort supports SNTP (RFC-1769) for automatic time
	calibration. The device server will request time information from the specified time server
	every 10 minutes.

7. Web Console: Network Settings

Overview

This chapter explains how to configure all settings located under the **Network Settings** folder in the NPort web console.

Network Settings

General Settings

On the General Settings page in the Network Settings folder, you can change DNS server 1 and 2.

DNS Server 1 and 2

Default	
Options	IP address (e.g., "192.168.1.1")
Description	This field is for the DNS server's IP address, if applicable. With the DNS server configured, the NPort device server can use domain names instead of IP addresses to access hosts.
	Domain Name System (DNS) is how Internet domain names are identified and translated into IP addresses. A domain name is an alphanumeric name, such as www.moxa.com, that it is usually easier to remember than the numeric IP address. A DNS server is a host that translates a text-based domain name into an IP address in order to establish a TCP/IP connection. When the user wants to visit a particular website, the user's computer sends the domain name (e.g., www.moxa.com) to a DNS server to request that website's numeric IP address. When the IP address is received from the DNS server, the user's computer uses that information to connect to the website's web server. The NPort will play the role of a DNS client, actively querying the DNS server for the IP address associated with a particular domain name.

Ethernet/Bridge Settings

To enable the Ethernet-to-Wireless function, also called Wireless Client, go to the **Ethernet/Bridge Settings** page and enable **Ethernet Bridge**. When it's enabled, the LAN and WLAN will use the same IP configuration (use the same IP address, netmask and gateway settings).

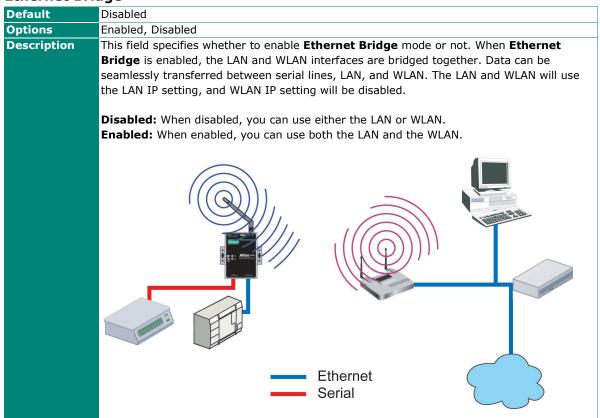

ATTENTION

In dynamic IP environments, the NPort will send three requests every 30 seconds to the DHCP server until the network settings have successfully been assigned. The first request will time out after one second; the second request will time out after three seconds, and the third request will timeout after five second. If the DHCP server is unavailable, the NPort will use the factory default network settings.

Ethernet Bridge

IP Configuration

Default	Static
Options	Static, DHCP
Description	This field determines how the NPort's IP address will be assigned.
	Static: IP address, netmask, and gateway are user-defined.
	DHCP: IP address, netmask, gateway, DNS, and time server are assigned by the DHCP
	server.

IP Address

Default	192.168.126.254
Options	IP address (e.g., "192.168.1.1")
Description	This field is for the IP address that will be assigned to your NPort device server. An IP
	address is a number assigned to a network device (such as a computer) as a permanent
	address on the network. Computers use the IP address to identify and talk to each other
	over the network. Choose a proper IP address that is unique and valid in your network
	environment. If your device server will be assigned a dynamic IP address, set the IP
	configuration parameter appropriately.

Netmask

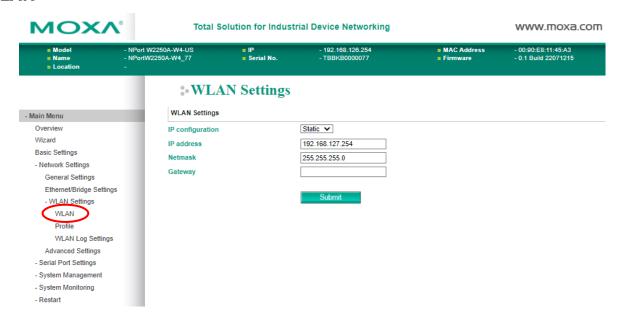

Default	255.255.255.0
Options	Netmask setting (e.g., "255.255.0.0")
Description	This field is for the subnet mask. A subnet mask represents all of the network hosts at one
	geographic location, in one building, or on the same local area network (LAN). When a
	packet is sent out over the network, the NPort device server will use the subnet mask to
	check whether the desired TCP/IP host specified in the packet is on the local network
	segment. If the address is on the same network segment as the device server, a
	connection is established directly from the device server. Otherwise, the connection is
	established through the gateway as specified in the Gateway parameter.

Gateway

Default	
Options	IP address (e.g., "192.168.1.1")
Description	This field is for the IP address of the gateway, if applicable. A gateway is a network
	computer that acts as an entrance to another network. Usually, the computers that control
	traffic within the network or at the local Internet service provider are gateway nodes. The
	NPort device server needs to know the IP address of the default gateway computer in order
	to communicate with the hosts outside the local network environment. Consult your
	network administrator if you do not know how to set this parameter.

WLAN Settings

WLAN

The WLAN page is located under WLAN Settings in the Network Settings folder. You can modify IP configuration, IP address, Netmask, and Gateway for your WLAN.

The NPort W2150A-W4/W2250A-W4 Series supports IEEE 802.11a/b/g/n wireless network interfaces. The supported IP configurations are static and dynamic (DHCP). Users can set up the IP configuration with the serial console, or the Web/Telnet consoles through the NPort's Ethernet interface. For detailed information about configuring **IP configuration**, **IP address**, **Netmask**, and **Gateway**, see the previous section, Ethernet Configuration.

IP Configuration

Default	Static
Options	Static, DHCP
Description	This field determines how the NPort's IP address will be assigned.
	Static: IP address, netmask, and gateway are user-defined.
	DHCP: IP address, netmask, gateway, DNS, and time server are assigned by the DHCP
	server.

IP Address

Default	192.168.127.254
Options	IP address (e.g., "192.168.1.1")
Description	This field is for the IP address that will be assigned to your NPort device server. An IP address is a number assigned to a network device (such as a computer) as a permanent address on the network. Computers use the IP address to identify and talk to each other over the network. Choose a proper IP address that is unique and valid in your WLAN
	environment. If your device server will be assigned a dynamic IP address, set the IP configuration parameter appropriately.

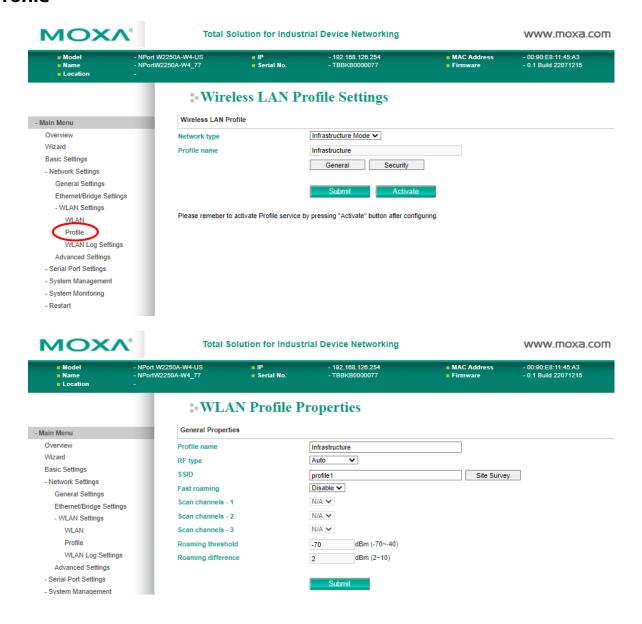

Netmask

Default	255.255.255.0
Options	Netmask setting (e.g., "255.255.0.0")
Description	This field is for the subnet mask. A subnet mask represents all the network hosts at one
	geographic location, in one building, or on the same LAN. When a packet is sent out over
	the network, the NPort device server will use the subnet mask to check whether the
	desired TCP/IP host specified in the packet is on the local network segment. If the address
	is on the same network segment as the device server, a connection is established directly
	from the device server. Otherwise, the connection is established through the gateway as
	specified in the Gateway parameter.

Gateway

Default	
Options	IP address (e.g., "192.168.1.1")
Description	This field is for the IP address of the gateway, if applicable. A gateway is a network
	computer that acts as an entrance to another network. Usually, the computers that control
	traffic within the network or at the local Internet service provider are gateway nodes. The
	NPort device server needs to know the IP address of the default gateway computer in order
	to communicate with the hosts outside the local network environment. Consult your
	network administrator if you do not know how to set this parameter.

Profile

The Profile page is located under WLAN Settings in the Network Settings folder. This is where you configure the NPort for Infrastructure operation. Different settings are available depending on whether you select AP Mode or Infrastructure Mode.

NOTE

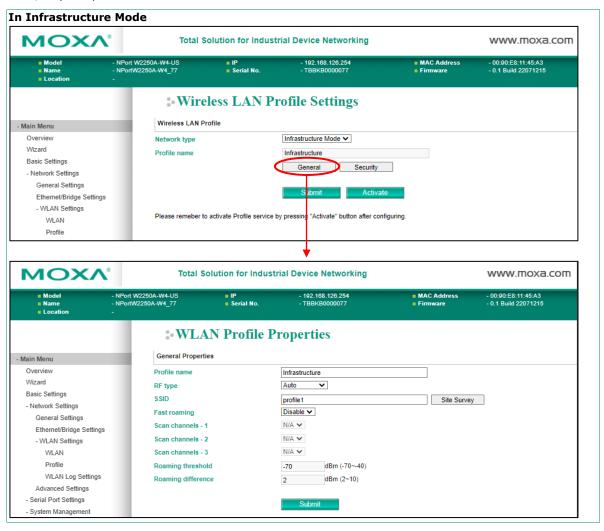

AP Mode is supported starting from firmware version V1.4 and later, and it can replace Ad-hoc mode application architecture of NPort W2x50A, achieving point-to-point connections.

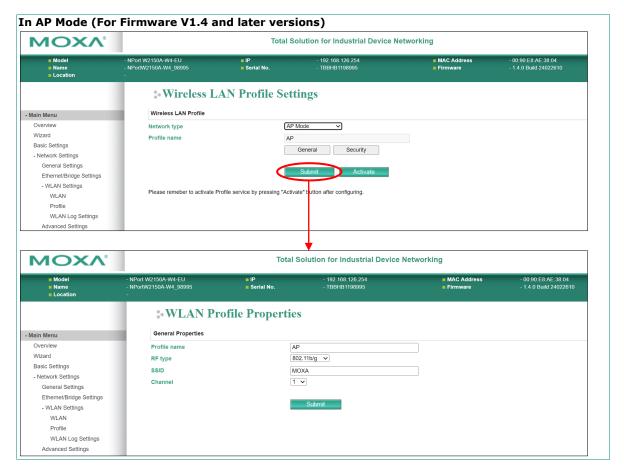

Network Type Default Infrastructure Mode **Options** Infrastructure Mode, AP Mode (For Firmware V1.4 and later versions) Description This field specifies whether the NPort will operate in AP or Infrastructure Mode. For all wireless networking devices, there are two possible modes for communication with another wireless device. Device that is configured for AP Mode acts as an AP and waiting for another device that is configured for Infrastructure Mode connecting to it. Wireless devices that are configured for Infrastructure Mode do not communicate directly with each other, but through a wireless access point (AP). **Example of Infrastructure Mode** Client **Example of AP Mode** Act as Client RS-232 After setting the Network type, you will need to adjust the General and Security settings to

establish the wireless connection.

General Settings for WLAN Profile

The **General** page is opened through the **Profile** page, under **WLAN Settings** in the **Network Settings** folder. You can type a profile name to help you differentiate one profile from another. It does not affect the operation of the NPort. Click **[General]** to open the General page for the selected profile. In Infrastructure Mode, only one profile is available.

On the General page, you can configure **Profile name**, **RF type**, and input an **SSID** provided by your Wi-Fi AP. Additional settings are also available depending on whether you select AP Mode or Infrastructure Mode.

Profile Name

Default	Infrastructure (in Infrastructure Mode), AP (in AP Mode)
Options	Free text (e.g., "Primary Connection")
Description	This is a free text field to help you differentiate one profile from another. It does not affect
	the operation of the NPort.

RF Type

Default	Auto for Infrastructure Mode.
Delauit	802.11b/g for AP Mode.
0	
Options	Auto (Infrastructure Mode only), 802.11a, 802.11b/g, 802.11a/n, 802.11b/g/n
Description	This field determines which wireless standard will be used by the selected profile. 802.11a,
	802.11b/g, 802.11a/n and 802.11b/g/n are supported.
	Auto: In Infrastructure Mode, the NPort will automatically select between 802.11a,
	802.11b/g, 802.11a/n and 802.11b/g/n according to the settings of the AP.
	802.11a: The Unlicensed National Information Infrastructure (UNII) 5 GHz band is used for communication, which is different from the RF band used by 802.11b and 802.11g. Consequently, 802.11a devices cannot communicate with 802.11b or 802.11g devices. (Multi-mode 802.11a/b/g APs or client adapters can be used to resolve this.) Transmission rates up to 54Mbps are supported.
	802.11b/g: This option means our device will support 802.11b or 802.11g.
	802.11b: This is the well-known "Wi-Fi" standard, also referred to as "802.11 High-Rate (HR)." Wireless communication is in the 2.4 GHz ISM band, using the DSSS spread spectrum transmission scheme. 802.11b supports data rates of 1 Mbps, 2 Mbps, 5.5 Mbps, and 11 Mbps.

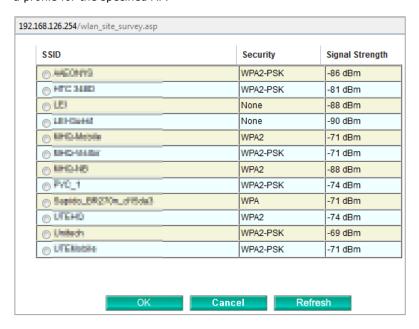

802.11a/n: This option means our device will support up to 150 Mbps data rate to communicate with an 802.11a/n AP. 802.11b/g/n: This option means our device will support up to 72.2 Mbps data rate to communicate to an 802.11b/g/n AP.

SSID

Default	Profile1 (in Infrastructure Mode), MOXA (in AP Mode)
Options	Free text (e.g., "Coffeeshop WLAN")
Description	This field specifies the SSID, or name, of the wireless network (SSID) that will be used by
	the NPort. Wireless devices must use the same SSID in order to communicate with each
	other.

Site Survey

When you click **Site Survey**, the device server will scan for all the APs it can find nearby. It shows all the signal strengths between the device server and the APs. You may check the checkbox and click **OK** to create a profile for the specified AP.

Channel (AP mode only)

Default	1				
Options					
		US	CN	EU	JP
	2.4G	1-11	1-13	1-13	1-13
	11b/g				
	11b/g/n				
	5G	36	36	36	36
	11a	40	40	40	40
	11a/n	44	44	44	44
		48	48	48	48
		149	149		
		153	153		
		157	157		
		161	161		
		165	165		
		1			-
Description	This field is	for AP Mod	e only and	specifies th	e radio
	channel to b		•	•	

Fast Roaming (Infrastructure mode only)

Default	Disable
Options	Disable, Enable
Description	This field is available in Infrastructure Mode and is used to specify the NPort W2150A-W4/W2250A-W4 Series roaming behavior. Roaming is the ability to connect to different APs so that wireless communication is not confined to one area or one particular AP. The NPort W2150A-W4/W2250A-W4 Series will only roam between APs, as specified by the SSID.
	Disable: Fast Roaming function will be disabled.
	NPort W2150A-W4/W2250A-W4 Series will scan all available channels and roam between APs as specified by the SSID. It scans the channel when booting up and will associate with the highest signal strength AP. Only when the associated AP is lost, it will re-associate again.
	Enable: Fast Roaming function will be enabled.
	NPort W2150A-W4/W2250A-W4 Series will only scan the pre-defined Scan Channels - 1, Scan Channels - 2 & Scan Channels - 3 and roam between APs as specified by the SSID.
	It scans the channel and will associate with the highest signal strength AP. It also scans the channel regularly and will re-associate with the highest signal strength AP (if there is) automatically.

Scan Channels – 1, Scan Channels – 2, Scan Channels – 3 (Infrastructure Mode)

Default	N/A
Options	1 through 13, 36, 40, 44, 48, 52, 56, 60, 64, 100, 104, 108, 112, 116, 120, 124, 128,
	132, 136, 140
Description	This field is for fast roaming under Infrastructure Mode and specifies the radio channel to
	use for the wireless network. Choose the channel according to the factory setting of the AP.

Roaming Threshold

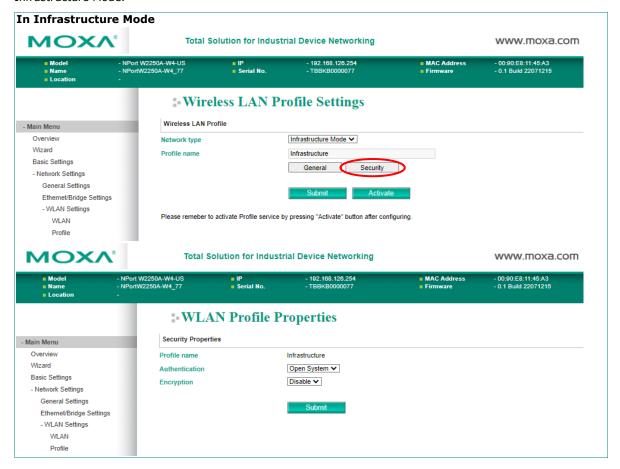

Default	-70 (Disable)
Options	numbers
Description	When the signal strength between the device and the AP is worse than this number, below
	-70 dBm as the default number, the device server will scan for a new AP to establish the
	connection.

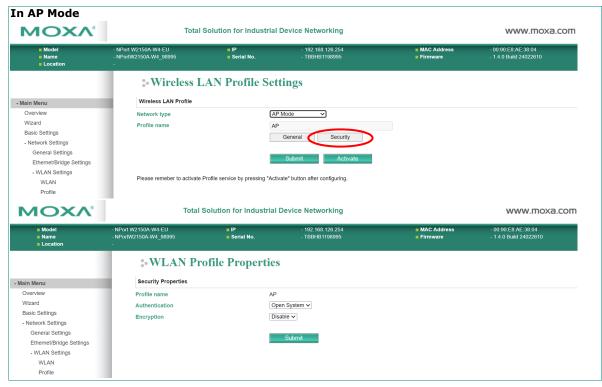

Roaming Difference

Default	2 (Disable)
Options	numbers
Description	When the device server finds a new AP, the signal strength between the device server and
	the new AP must be above this number compared to the old AP, then the device server will
	change to establish a new connection with the new AP. For example, when the signal
	strength to the old AP is -70 dBm. When the new AP is -69 dBm, the device server will
	keep the connection to the old one. If the new AP is -68 dBm, the device server will switch
	the connection to the new AP.

Security Settings for WLAN Profile

The **Security** page is opened through the **Profile** page, under **WLAN Settings** in the **Network Settings** folder. In Infrastructure Mode, click **[Security]** to open the Security page. Three profiles are available in Infrastructure Mode.

You will need to configure **Authentication** and **Encryption**. These settings must match the settings on the wireless device at the other end of the connection (such as the AP). Different settings and options are available depending on how **Authentication** and **Encryption** are configured.

Authentication

Authentica	
Default	Open System
Options	Open System, Shared Key, WPA, WPA-PSK, WPA2, WPA2-PSK
Description	This field specifies how wireless devices will be authenticated. Only authenticated devices will be allowed to communicate with the NPort. If a RADIUS server is used, this setting must match the setting on the RADIUS server.
	Open System: The NPort will simply announce a desire to associate with access point. No authentication is required.
	Shared Key: Authentication involves a more rigorous exchange of frames to ensure that the requesting station is authentic. WEP encryption is required.
	WPA: This is a managed authentication option in Infrastructure Mode. The Wi-Fi Alliance, the industry trade group that owns the Wi-Fi trademark and certifies devices with the Wi-Fi name created WPA. It is based on Draft 3 of the IEEE 802.11i standard. Each user uses a unique key for authentication, distributed from an IEEE 802.1X authentication server, also known as a RADIUS server. We also referred this option to as WPA Enterprise Mode, since it should meet rigorous enterprise security requirements. Tunneled authentication is supported, depending on the EAP method selected.
	WPA-PSK: This is an unmanaged authentication option in Infrastructure Mode. Instead of a unique key for each user, a pre-shared key (PSK) is manually entered on the access point to generate an encryption key that is shared among all users. Consequently, this method does not scale well for enterprise. A PSK that uses a mix of letters, numbers and non-alphanumeric characters is recommended. This option is also referred to as WPA Personal Mode, since it is designed for the needs and capabilities of small home and office WLANs.
	WPA2: This is a managed authentication option in Infrastructure Mode. WPA2 implements the mandatory elements of 802.11i. Supported encryption algorithms include TKIP, Michael, and AES-based CCMP, which is considered fully secure. Since March 13, 2006, WPA2 has been mandatory for all Wi-Fi-certified devices. We may also refer this option to as WPA2 Enterprise Mode. Tunneled authentication is supported, depending on the EAP method selected.
	WPA2-PSK: This is an unmanaged authentication option in Infrastructure Mode. It employs WPA2 encryption algorithms but relies on a PSK for authentication. A PSK that uses a mix of letters, numbers and non-alphanumeric characters is recommended. We can also refer this option to as WPA Personal Mode.

Encryption

Default Disable **Options** Disable, WEP, TKIP, AES-CCMP **Description** This field specifies the type of encryption to use during wireless communication. Different encryption methods are available depending on the Authentication setting. Also, each encryption method has its own set of parameters that may also require configuration.

Disable: No encryption applies to the data during wireless communication. This option is only available if Authentication is set to Open System.

WEP: Wired Equivalent Privacy (WEP) is only available for Open System and Shared Key authentication methods. Data is encrypted according to a key. The NPort supports both 64 and 128-bit keys. This method may deter casual snooping, but is not considered very secure.

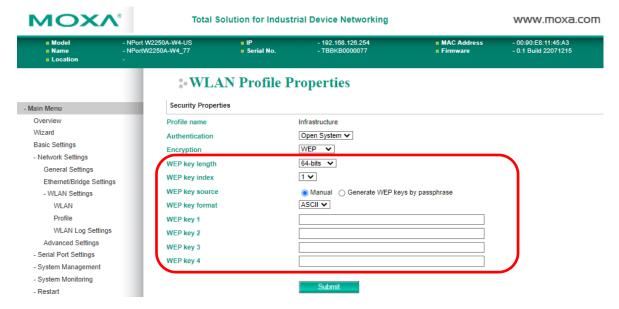

TKIP: Temporal Key Integrity Protocol (TKIP) is only available for WPA, WPA2, WPA-PSK, and WPA2-PSK authentication methods. TKIP is part of a draft standard from the IEEE 802.11i working group and uses the RC4 stream cipher with 128-bit keys for encryption and 64-bit keys for authentication. TKIP improves on WEP by adding a per-packet key mixing function to de-correlate the public initialization vectors (IVs) from weak keys.

AES-CCMP: This is a powerful encryption method that is only available for WPA, WPA2, WPA-PSK, and WPA2-PSK authentication methods. Advanced Encryption Standard (AES) is the block cipher system used by the Robust Secure Network (RSN) protocol and is equivalent to the RC4 algorithm used by WPA. CCMP is the security protocol used by AES, equivalent to TKIP for WPA. Data undergoes a Message Integrity Check (MIC) using a wellknown and proven technique called Cipher Block Chaining Message Authentication Code (CBC-MAC). The technique ensures that even a one-bit alteration in a message produces a dramatically different result. Master keys are not used directly but are used to derive other keys, each of which expire after a certain amount of time. Messages are encrypted using a secret 128-bit key and a 128-bit block of data. The encryption process is complex, but the administrator does not need to be aware of the intricacies of the computations. The result is encryption that is much harder to break than even WPA.

PSK Passphrase

Default	
Options	free text (e.g., "This is the WLAN passphrase")
Description	This field is only available for WPA-PSK and WPA2-PSK authentication methods. If the
	NPort's passphrase does not match the AP's passphrase, the connection will be denied. A
	PSK of sufficient strength—one that uses a mix of letters, numbers and non-alphanumeric
	characters—is recommended.

Security Settings for WEP Encryption

When Encryption is set to WEP on the **Security** page for the WLAN profile, you will configure **WEP key length**, **WEP key index**, and **WEP key source**. It will display other settings, depending on how **WEP key source** is configured.

WEP Key Length

Default	64bits
Options	64bits, 128bits
Description	This field specifies the length of the WEP key. 64bits is the industry standard for WEP, but
	128bits provides better protection.

WEP Key Index

•	
Default	1
Options	1 through 4
Description	This field specifies the primary WEP key to use for the WLAN.

WEP Key Source

Default	Manual
Options	Manual, Generate WEP keys by passphrase
Description	This field specifies whether the WEP key will be generated manually or through a user-
	specified passphrase. A passphrase is equivalent to a free-text password that will generate
	the WEP key. A passphrase is typically easier to remember and enter than a long and
	complicated WEP key.

WEP Passphrase

Default	
Options	free text (e.g., "This is the WEP passphrase")
Description	This field is only available if WEP key source is set to Generate WEP keys by
	passphrase. A standard hexadecimal password will be generated using the supplied
	passphrase. For example, if "404tech" is entered, the WEP key will be
	"DB971608E942FC39BD89FC4ADB".

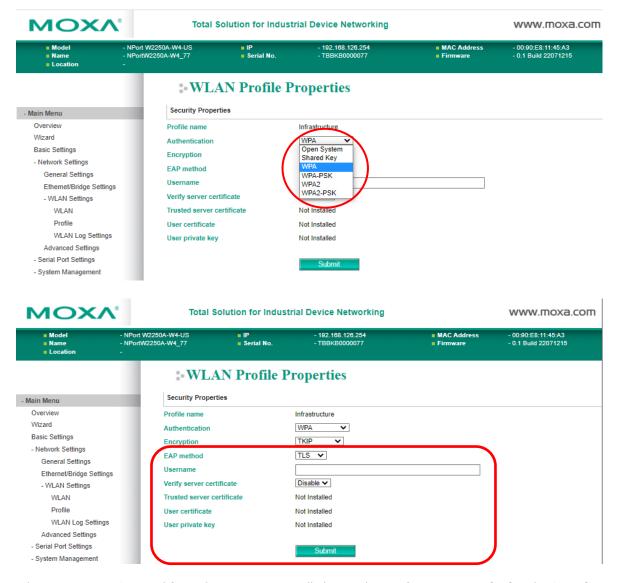

WEP Key Format

Default	ASCII
Options	ASCII, HEX
Description	This field is only available if WEP key source is set to Manual. It specifies the format you
	will use to enter the WEP key.

WEP Key 1 Through 4

Default				
Options	free text in ASCII or HEX			
Description	These fields are only available if WEP key source is set to Manual. Enter each WEP key in ASCII or HEX as specified in WEP key format. The number of characters required for each key depends on WEP key length and WEP key format.			
	WEP Key Length	WEP Key Format	Key Length	
	64bits	ASCII	5 characters	
		HEX	10 characters	
	128bits	ASCII	13 characters	
		HEX	26 characters	

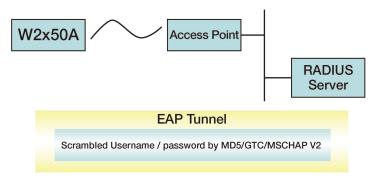

Security Settings for WPA, WPA2

When WPA or WPA2 is used for authentication, you will also need to configure **EAP method** in the **Security** settings for the WLAN profile. It will also display other settings, depending on how **EAP method** is configured.

There are two parts to WPA and WPA2 security, authentication, and data encryption.

Authentication occurs before access is granted to a WLAN. Wireless clients such as the NPort W2150A-W4/W2250A-W4 Series are first authenticated by the AP according to the authentication protocol used by the RADIUS server. Depending on the WLAN security settings, an EAP tunnel can scramble the username and password that is submitted for authentication purposes.

• Encryption occurs after WLAN access has been granted. For all wireless devices, data is first encrypted before wireless transmission, using mutually agreed-upon encryption protocol.

EAP Method

LAF MELIIO	
Default	PEAP
Options	TLS, PEAP, TTLS, LEAP
Description	This field specifies the EAP method to use for authentication. Four methods are supported.
	TLS: Transport Layer Security (TLS) was created by Microsoft and accepted by the IETF as RFC 2716: PPP EAP TLS Authentication Protocol. Passwords and tunneled authentication
	are not used. A user certificate and user private key are used to identify the NPort. The NPort's user certificate and user private key must already be installed on the RADIUS server.
	PEAP: Protected Extensible Authentication Protocol (PEAP) is a proprietary protocol which was developed by Microsoft, Cisco, and RSA Security.
	TTLS: Tunneled Transport Layer Security (TTLS) is a proprietary protocol which was developed by Funk Software and Certicom, and is supported by Agere Systems, Proxim, and Avaya. TTLS is being considered by the IETF as a new standard. For more information on TTLS, read the draft RFC EAP Tunneled TLS Authentication Protocol.
	LEAP: Lightweight Extensible Authentication Protocol (LEAP) is a proprietary protocol which was developed by Cisco. LEAP doesn't check certificate during the authentication process.

Tunneled Authentication

Default	PAP (when using TTLS)
	GTC (when using PEAP)
Options	GTC, MD5, MSCHAP V2 (when using PEAP)
	PAP, CHAP, MSCHAP, MSCHAP V2, EAP-MSCHAP V2, EAP-GTC,
	EAP-MD5 (when using TTLS)
Description	This field specifies the encryption method to use during the authentication process.
	Different methods are available, depending on the EAP Method setting.

Username

Default	
Options	free text (e.g., "Smith_John")
Description	This field specifies the username that will gain access to the WLAN. The correct username
	and password must be provided for access to be granted.

Password

Default	
Options	free text (e.g., "Password123")
Description	This field specifies the password that will gain access to the WLAN. The correct username
	and password must be provided for access to be granted.

Anonymous Username

Default	
Options	free text (e.g., "Anyuser")
Description	This field specifies the anonymous username to use when starting authentication. After the
	RADIUS Server has been verified by certificate, the true username and password will
	complete the authentication process.

Verify Server Certificate

Default	Disable
Options	Disable, Enable
Description	Disable: The certificate from the RADIUS server will be ignored.
	Enable: The certificate from the RADIUS server will authenticate access to the WLAN. The
	RADIUS server's trusted server certificate must already be installed on the NPort. To install
	a trusted server certificate, visit the corresponding page in the System Management>
	Certificate folder.

Trusted Server Certificate

This field is available for PEAP, TLS, and TTLS EAP methods only. It displays information on the trusted server certificate that is installed on the NPort. To install a trusted server certificate, visit the corresponding page in the **System Management > Certificate** folder.

User Certificate

This field is available only when the EAP method has been set to TLS. It displays information on the user certificate that is installed on the NPort. To install a user certificate, visit the corresponding page in the **System Management > Certificate** folder.

User Private Key

This field is available only when EAP method has been set to TLS. It displays information on the user private key on the NPort.

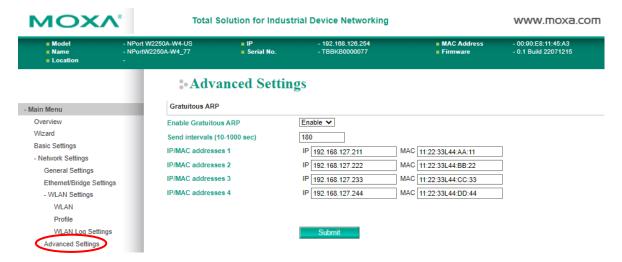

WLAN Log Settings

WLAN Log Settings

Default	Disable
Options	Disable, Enable
Description	When the wireless connection between the device server and the AP is not stable, you may
	enable this function to have more information for troubleshooting. You may find System
	Monitoring → System Status → WLAN Log for the detail logs. Before calling for help
	from Moxa, please enable this function to collect some information.

Advanced Settings

On the **Advanced Settings** page in the **Network Settings** folder, you can change **Gratuitous ARP**. For this function, the NPort will actively send ARP packets to inform the devices in the network on how to find the NPort. If you enable Ethernet/Bridge mode, you can input the IP/MAC address of the legacy device that is connected to the Ethernet port of the NPort. The NPort will help to send out the ARP packets with its IP address to inform the network on how to find this legacy device.

Gratuitous ARP

Default	Enabled
Options	Enable / Disable
Description	Gratuitous ARP requests provide duplicate IP address detection. The NPort sends broadcast packets to update ARP tables on other devices (e.g., AP, PC) periodically. We can use this function to notify networked devices that the NPort is still alive. Moreover, the NPort can send Gratuitous ARP for legacy devices that do not have this function. If you want the NPort to send Gratuitous ARP for legacy devices, enter the legacy devices' IP and Mac addresses in IP/MAC address field.

Send Period

Default	180 seconds
Options	10-1000 seconds
Description	This field specifies how long the NPort periodically sends Gratuitous ARP.

IP/MAC Addresses

Default	N/A
Options	IP address and MAC address of the legacy device (e.g., IP: "192.168.1.1", MAC:
	"11:22:33:44:AA:11"). This function is only available when Ethernet Bridge is enabled.
Description	IP address: legacy device IP address.
	MAC address: legacy devices MAC address.

8. Web Console: Serial Port Settings

Overview

This chapter explains how to configure all settings located under the **Serial Port Settings** folder in the NPort web console.

Serial Port Settings

Operation Modes

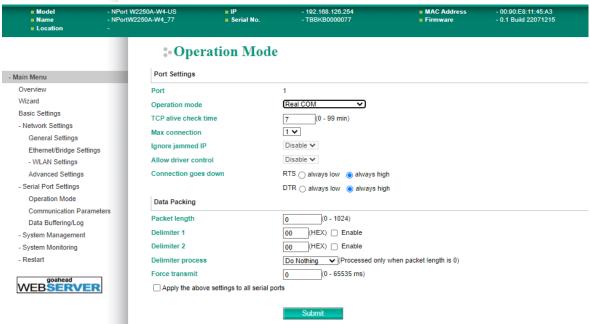

Each serial port on the NPort is configured through the hyperlink below the column of Operating mode.

Click the link of **Real COM**. It will show the Port settings page. The Operation Modes page for each serial port is where you configure the serial port's operation mode and related settings. For an introduction to the different operation modes, please refer to Chapter 4.

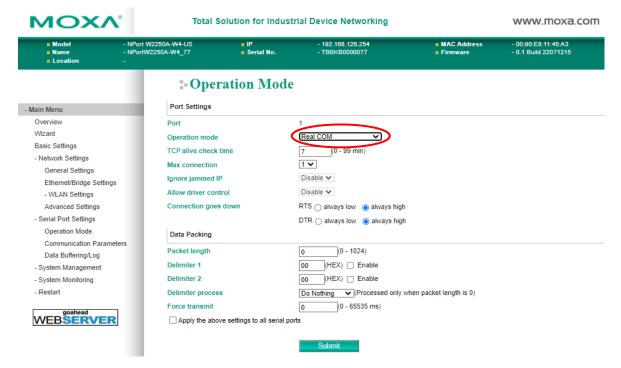

Operation Mode

Default	Real COM
Options	Real COM, RFC2217, TCP Server, TCP Client, UDP, Pair_Master, Pair_Slave, EModem
Description	Along with the application, this field specifies the serial port's operation mode, or how it will interact with network devices. Depending on how the application is configured, different options are available for Operation Mode. Depending on how Mode is configured, additional settings will be available for configuration. For an introduction to the different operation modes, please refer to Chapter 4. Real COM: This serial port will operate in Real COM mode.
	RFC2217: This serial port will operate in RFC2217 mode.
	TCP Server: This serial port will operate in TCP Server mode.
	TCP Client: This serial port will operate in TCP Client mode.
	UDP: This serial port will operate in UDP mode.
	Pair_Master: This serial port will operate in Pair Connection Master mode.
	Pair_Slave: This serial port will operate in Pair Connection Slave mode.
	EModem: This serial port will operate in Ethernet Modem mode.

Settings for Real COM Mode

When **Operation Mode** is set to Real COM on a serial port's **Operation Modes** page, you will configure additional settings including **TCP alive check time**, **Max connection**, **Ignore jammed IP**, **Allow driver Control**, **Connection goes down**, **Packet length**, **Delimiter 1**, **Delimiter 2**, **Delimiter process**, and **Force transmit**.

TCP Alive Check Time

Default	7 min
Options	0 to 99 min
Description	This field specifies how long the NPort will wait for a response to "keep-alive" packets
	before closing the TCP connection. The NPort checks connection status by sending periodic
	"keep- alive" packets.
	0: The TCP connection will remain open even if there is no response to the "keep-alive"
	packets.
	1 to 99: If the remote host does not respond to the packet within the specified time, the
	NPort will force the existing TCP connection to close.

Max Connection

Default	1
Options	1 to 8
Description	This field specifies the maximum number of connections the serial port will accept.
	1: Only one specific host can access this serial port, and the Real COM driver on that host
	will have full control over the port.
	2 to 8: This serial port will allow the specified number of connections to be opened
	simultaneously. With simultaneous connections, the Real COM driver will only provide a
	pure data tunnel with no control ability. The serial communication will be determined by
	the NPort rather than by your application program. Application software that is based on
	the Real COM driver will receive a driver response of "success" when using any of the
	Win32 API functions. The NPort will send data only to the Real COM driver on the host.
	Data received from hosts will be sent to the attached serial device on a first-in-first-out
	basis.

ATTENTION

When Max connection is two or greater, the serial port's communication settings (i.e., baudrate, parity, data bits, etc.) will be determined by the NPort. Any host that opens the COM port connection must use identical serial communication settings.

Ignore Jammed IP

Default	Disable
Options	Disable, Enable
Description	This field specifies how an unresponsive IP address is handled when there are simultaneous connections to the serial port.
	Disable: All transmissions will be suspended if one IP address becomes unresponsive. Transmission will only resume when all hosts have responded.
	Enable: Data transmission to the other hosts will not be suspended if one IP address becomes unresponsive.

Allow Driver Control

Default	Disable
Options	Disable, Enable
Description	This field specifies how the port will proceed if driver control commands are received from multiple hosts that are connected to the port.
	Disable: Driver control commands will be ignored.
	Enable: Control commands will be accepted, with the most recent command received taking precedence.

Connection Goes Down

Default	always high
Options	always low, always high
Description	This field specifies what happens to the RTS and DTR signals when the Ethernet connection goes down. For some applications, serial devices need to know the Ethernet link status through RTS or DTR signals sent through the serial port.
	Always low: The selected signal will change to low when the Ethernet connection goes down. Always high: The selected signal will remain high when the Ethernet connection goes down.

Packet Length

Default	0
Options	0 to 1024
Description	This field specifies the maximum amount of data that is allowed to accumulate in the serial port buffer before sending.
	0: Packet length is disregarded and data in the buffer will be sent as specified by the delimiter settings or when the buffer is full.
	1 to 1024: Data in the buffer will be sent as soon it reaches the specified length.

Delimiter 1 and 2

Default	Disabled
Options	Disabled, Enabled, 00 to FF
Description	These fields are used to define special delimiter character(s) for data packing. Enable Delimiter 1 to control data packing with a single character; enable both Delimiter 1 and 2 to control data packing with two characters received in sequence.
	When these fields are enabled, serial data will accumulate in the serial port's buffer until the buffer is full or until the specified delimiter character(s) are received. For example, the carriage return character could be used as a delimiter in order to transmit each sentence or paragraph in a separate packet. Data will be packed according to the Delimiter process.
	Delimiters must be incorporated into the data stream at the software or device level.

ATTENTION

When $\mbox{\bf Delimiter 1}$ is enabled, $\mbox{\bf Packet length}$ must be set to 0.

Delimiter Process

Default	Do Nothing
Options	Do Nothing, Delimiter + 1, Delimiter + 2, Strip Delimiter
	This field specifies how data is packed when delimiter characters are received. This field has no effect if Delimiter 1 is not enabled.
	Do nothing: Data accumulated in the serial port's buffer will be packed, including delimiters.
Description	Delimiter + 1: One additional character must be received before the data in the serial port's buffer is packed.
	Delimiter + 2: Two additional characters must be received before the data in the serial port's buffer is packed.
	Strip Delimiter: Data accumulated in the serial port's buffer will be packed, but the delimiter character(s) will be stripped from the data.

Force Transmit

Default	0 ms
Options	0 to 65535
Description	This field controls data packing by the time that elapses between bits of data. When using this field, make sure that Inactivity time is disabled or set to a larger value. Otherwise, the connection may be closed before the data in the buffer can be transmitted. 0: If serial data is not received, the NPort will wait indefinitely for additional data. 1 to 65535: If serial data is not received for the specified amount of time, the data that is currently in the buffer will be packed for network transmission. The optimal force transmit time depends on your application, but it must be at least larger than one character interval within the specified baudrate. For example, assume that the serial port is set to 1200 bps, 8 data bits, 1 stop bit, and no parity. In this case, the total number of bits needed to send a character is 10 bits, and the time required to transfer one character is 8.3 ms, so the force transmit time must be larger than 8.3 ms.

Settings for RFC2217 Mode

When **Operation Mode** is set to **RFC2217** on a serial port's **Operation Modes** page, you will configure additional settings, including **TCP alive check time**, **TCP port**, **Packet length**, **Delimiter 1**, **Delimiter 2**, **Delimiter process**, and **Force transmit**.

TCP Alive Check Time

Default	7 min
Options	0 to 99 min
Description	This field specifies how long the NPort will wait for a response to "keep-alive" packets before closing the TCP connection. The NPort checks connection status by sending periodic "keep-alive" packets. 0: The TCP connection will remain open even if there is no response to the "keep-alive"
	packets. 1 to 99: If the remote host does not respond to the packet within the specified time, the NPort will force the existing TCP connection to close.

TCP Port

Default	4001
Options	
Description	This field specifies the TCP port number that the serial port will use to listen to connections,
	and that other devices must use to contact the serial port.

Packet Length

Default	0
Options	0 to 1024
Description	This field specifies the maximum amount of data that is allowed to accumulate in the serial port buffer before sending.
	0: Packet length is disregarded and data in the buffer will be sent as specified by the delimiter settings or when the buffer is full.
	1 to 1024: Data in the buffer will be sent as soon it reaches the specified length.

Delimiter 1 and 2

Default	Disabled
Options	Disabled, Enabled, 00 to FF
Description	These fields are used to define special delimiter character(s) for data packing. Enable Delimiter 1 to control data packing with a single character; enable both Delimiter 1 and 2 to control data packing with two characters received in sequence.
	When these fields are enabled, serial data will accumulate in the serial port's buffer until the buffer is full or until the specified delimiter character(s) are received. For example, the carriage return character could be used as a delimiter in order to transmit each sentence or paragraph in a separate packet. Data will be packed according to the Delimiter process. Delimiters must be incorporated into the data stream at the software or device level.

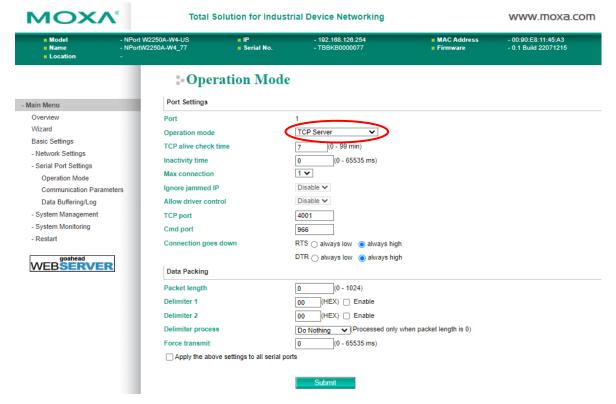

Delimiter Process

Default	Do Nothing
Options	Do Nothing, Delimiter + 1, Delimiter + 2, Strip Delimiter
Description	This field specifies how data is packed when delimiter characters are received. This field has no effect if Delimiter 1 is not enabled.
	Do nothing: Data accumulated in the serial port's buffer will be packed, including delimiters.
	Delimiter + 1: One additional character must be received before the data in the serial port's buffer is packed.
	Delimiter + 2: Two additional characters must be received before the data in the serial port's buffer is packed.
	Strip Delimiter: Data accumulated in the serial port's buffer will be packed, but the delimiter character(s) will be stripped from the data.

Force Transmit

Default	0 ms
Options	0 to 65535
Description	This field controls data packing by the time that elapses between bits of data. When using this field, make sure that Inactivity time is disabled or set to a larger value. Otherwise, the connection may be closed before the data in the buffer can be transmitted.
	0: If serial data is not received, the NPort will wait indefinitely for additional data. 1 to 65535: If serial data is not received for the specified amount of time, I will pack the data that is currently in the buffer for network transmission. The optimal force transmit time depends on your application, but it must be at least larger than one character interval within the specified baudrate. For example, assume that the serial port is set to 1200 bps, 8 data bits, 1 stop bit, and no parity. In this case, the total number of bits needed to send a character is 10 bits, and the time required to transfer one character is 8.3 ms, so the force transmit time must be larger than 8.3 ms.

Settings for TCP Server Mode

When **Operation Mode** is set to **TCP Server** on a serial port's **Operation Modes** page, configure additional settings such as **TCP alive check time**, **Inactivity time**, **Max connection**, **Ignore jammed IP**, **Allow driver control**, **TCP port**, **Cmd port**, **Connection goes down**, **Packet length**, **Delimiter 1**, **Delimiter 2**, **Delimiter process**, and **Force transmit**.

TCP Alive Check Time

Default	7 min
Options	0 to 99 min
Description	This field specifies how long the NPort will wait for a response to "keep-alive" packets before closing the TCP connection. The NPort checks connection status by sending periodic "keep-alive" packets. 0: The TCP connection will remain open even if there is no response to the "keep-alive" packets.
	1 to 99: If the remote host does not respond to the packet within the specified time, the NPort will force the existing TCP connection to close.

Inactivity Time

Default	0 ms
Options	0 to 65535 ms
Description	This field specifies the time limit for keeping the connection open if no data flows to or from the serial device.
	0: The connection will remain open even if data is never received. For many applications, the serial device may be idle for long periods of time, so 0 is an appropriate setting.
	1 to 65535: If there is no activity for the specified time, the connection will be closed. When adjusting this field, make sure that it is greater than the Force transmit time. Otherwise, the TCP connection may be closed before data in the buffer can be transmitted.

Max Connection

Default	1
Options	1 to 8
Description	This field specifies the maximum number of connections that the serial will accept port.
	1: Only one specific host can access this serial port, and the Real COM driver on that host will have full control over the port.
	2 to 8: This serial port will allow the specified number of connections to be opened simultaneously. With simultaneous connections, the Real COM driver will only provide a pure data tunnel with no control ability. The serial communication will be determined by the NPort rather than by your application program. Application software that is based on the Real COM driver will receive a driver response of "success" when using any of the Win32 API functions. The NPort will send data only to the Real COM driver on the host. Data received from hosts will be sent to the attached serial device on a first-in-first-out
	basis.

ATTENTION

When Max connection is two or greater, the serial port's communication settings (i.e., baudrate, parity, data bits, etc.) will be determined by the NPort. Any host that opens the COM port connection must use identical serial communication settings.

Ignore Jammed IP

Default	Disable
Options	Disable, Enable
Description	This field specifies how an unresponsive IP address is handled when there are simultaneous connections to the serial port.
	Disable: All transmission will be suspended if one IP address becomes unresponsive. Transmission will only resume when all hosts have responded.
	Enable: Data transmission to the other hosts will not be suspended if one IP address becomes unresponsive.

Allow Driver Control

Default	Disable
Options	Disable, Enable
Description	This field specifies how the port will proceed if driver control commands are received from multiple hosts that are connected to the port. Disable: Driver control commands will be ignored. Enable: Control commands will be accepted, with the most recent command received
	taking precedence.

TCP Port

Default	4001
Options	0 to 9999
Description	This field specifies the TCP port number that the serial port will use to listen to connections,
	and that other devices must use to contact the serial port.

Cmd Port

Default	966
Options	
Description	This field specifies the TCP port number for listening to IP-Serial Lib commands from the
	host.

IP Serial Library Introduction

What is IP Serial Library?

IP Serial Library is a Windows library with frequently used serial command sets and subroutines. IP Serial Library reduces the complexity and poor efficiency of serial communication over TCP/IP. For example, Telnet can only transfer data, but it can't monitor or configure the serial line's parameters.

Why Use IP Serial Library?

For programmers who are familiar with serial communication, IP Serial Library provides well-designed function calls that have the same style as Moxa's PComm Library.

IP Serial Library is amazingly simple and easy to understand. By including it in your VB, C, or Delphi programming environment, you can program your own TCP/IP application with the ability to control serial communication parameters.

The NPort Serial Device Servers use 2 TCP ports for communication between the NPort and host computer's Real COM driver. The NPort uses a data port and command port to provide pure data transfer without decoding and encoding. Compared to using only one TCP port to control serial communication (such as RFC 2217), IP Serial Library uses a command port to communicate with NPort in user's program. IP Serial Library not only runs with excellent efficiency, but also runs with no decoding or encoding problems.

You can find the usage of other functions in the subsection of **Real COM** mode in page 7-4.

Connection Goes Down

Default	Always high
Options	Always low, always high
Description	This field specifies what happens to the RTS and DTR signals when the Ethernet connection goes down. For some applications, serial devices need to know the Ethernet link status through RTS or DTR signals sent through the serial port.
	Always low: The selected signal will change to low when the Ethernet connection goes down.
	Always high: The selected signal will remain high when the Ethernet connection goes down.

Packet Length

Default	0
Options	0 to 1024
Description	This field specifies the maximum amount of data that is allowed to accumulate in the serial port buffer before sending.
	0: Packet length is disregarded and data in the buffer will be sent as specified by the delimiter settings or when the buffer is full.1 to 1024: Data in the buffer will be sent as soon it reaches the specified length.

Delimiter 1 and 2

Default	Disabled
Options	Disabled, Enabled, 00 to FF
Description	These fields are used to define special delimiter character(s) for data packing. Enable Delimiter 1 to control data packing with a single character; enable both Delimiter 1 and 2 to control data packing with two characters received in sequence.
	When these fields are enabled, serial data will accumulate in the serial port's buffer until the buffer is full or until the specified delimiter character(s) are received. For example, the carriage-return character could be used as a delimiter in order to transmit each sentence or paragraph in a separate packet. Data will be packed according to the Delimiter process.
	Delimiters must be incorporated into the data stream at the software or device level.

ATTENTION

When Delimiter 1 is enabled, Packet length must be set to 0.

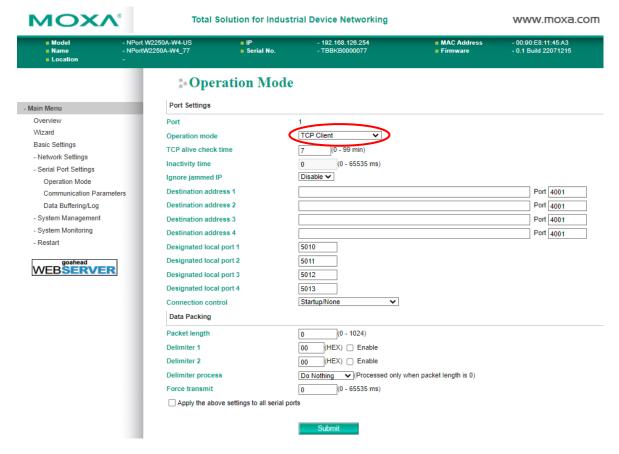

Delimiter Process

Default	Do Nothing
Options	Do Nothing, Delimiter + 1, Delimiter + 2, Strip Delimiter
Description	This field specifies how data is packed when delimiter characters are received. This field has no effect if Delimiter $\bf 1$ is not enabled.
	Do nothing: Data accumulated in the serial port's buffer will be packed, including delimiters.
	Delimiter \pm 1: One additional character must be received before the data in the serial port's buffer is packed.
	Delimiter + 2: Two additional characters must be received before the data in the serial port's buffer is packed.
	Strip Delimiter: Data accumulated in the serial port's buffer will be packed, but the delimiter character(s) will be stripped from the data.

Force Transmit

Default	0 ms
Options	0 to 65535
Description	This field controls data packing by the time that elapses between bits of data. When using this field, make sure that Inactivity time is disabled or set to a larger value. Otherwise, the connection may be closed before the data in the buffer can be transmitted.
	0: If serial data is not received, the NPort will wait indefinitely for additional data.
	1 to 65535: If serial data is not received for the specified amount of time, the data that is currently in the buffer will be packed for network transmission. The optimal force transmit time depends on your application, but it must be at least larger than one character interval within the specified baudrate. For example, assume that the serial port is set to 1200 bps, 8 data bits, 1 stop bit, and no parity. In this case, the total number of bits needed to send a character is 10 bits, and the time required to transfer one character is 8.3 ms, so the force transmit time must be larger than 8.3 ms.

Settings for TCP Client Mode

When **Operation Mode** is set to **TCP Client** on a serial port's **Operation Modes** page, you will be able to configure additional settings such as **TCP alive check time**, **Inactivity time**, **Ignore jammed IP**, **Destination address 1-4**, **Designated local port 1-4**, **Connection control, and Packet length**, **Delimiter 1**, **Delimiter 2**, **Delimiter process**, and **Force transmit**.

TCP Alive Check Time

Default	7 min
Options	0 to 99 min
Description	This field specifies how long the NPort will wait for a response to "keep-alive" packets before closing the TCP connection. The NPort checks connection status by sending periodic "keep-alive" packets. 0: The TCP connection will remain open even if there is no response to the "keep-alive" packets.
	1 to 99: If the remote host does not respond to the packet within the specified time, the NPort will force the existing TCP connection to close.

Inactivity Time

Default	0 ms
Options	0 to 65535 ms
Description	This field specifies the time limit for keeping the connection open if no data flows to or from the serial device.
	0: The connection will remain open even if data is never received. For many applications, the serial device may be idle for long periods of time, so 0 is an appropriate setting.
	1 to 65535: If there is no activity for the specified time, the connection will be closed. When adjusting this field, make sure that it is greater than the Force transmit time. Otherwise, the TCP connection may be closed before data in the buffer can be transmitted.

Ignore Jammed IP

Default	Disable
Options	Disable, Enable
Description	This field specifies how an unresponsive IP address is handled when there are simultaneous connections to the serial port.
	Disable: All transmission will be suspended if one IP address becomes unresponsive. Transmission will only resume when all hosts have responded.
	Enable: Data transmission to the other hosts will not be suspended if one IP address becomes unresponsive.

Destination Address 1 to 4

Default	
Options	IP address and port (e.g., "192.168.1.1" and "4001")
Description	This field specifies the remote host(s) that will access the attached device. At least one
	destination must be provided. This field supports the use of domain names and names
	defined in the host table.

ATTENTION

In TCP Client mode, up to four connections can be established between the serial port and TCP hosts. The connection speed or throughput may be low if any one of the four connections is slow, since the one slow connection will slow down the other three connections.

Designated Local Port 1 to 4

Default	
Options	1 to 65535
Description	This field specifies the TCP port number that will be used for data transmission with the
	serial port.

Connection Control

Default	Startup/None
Options	Startup/None, Any Character/None, Any Character/Inactivity Time, DSR On/DSR Off, DSR
	On/None, DCD On/DCD Off, DCD On/None
Description	This field specifies how connections to the device are established and closed.
	Startup/None: The connection will be opened as the NPort starts up. The connection will only be closed manually.
	Any Character/None: The connection will be opened as soon as a character is received from the attached device. The connection will only be closed manually.
	Any Character/Inactivity Time: The connection will be opened as soon as a character is received from the attached device. The connection will be closed if no data is received for the time specified in the Inactivity time.
	DSR On/DSR Off: The TCP connection is opened when the DSR signal is on, and closed when the DSR signal is off.
	DSR On/None: The TCP connection is opened when the DSR signal is on. The connection will only be closed manually.
	DCD On/DCD Off: The TCP connection is opened when the DCD signal is on, and closed when the DCD signal is off.
	DCD On/None: The TCP connection is opened when the DCD signal is on. The connection will only be closed manually.

Packet Length

Default	0
Options	0 to 1024
Description	This field specifies the maximum amount of data that is allowed to accumulate in the serial port buffer before sending.
	0: Packet length is disregarded and data in the buffer will be sent as specified by the delimiter settings or when the buffer is full.
	1 to 1024: Data in the buffer will be sent as soon it reaches the specified length.

Delimiter 1 and 2

Default	Disabled
Options	Disabled, Enabled, 00 to FF
Description	These fields are used to define special delimiter character(s) for data packing. Enable Delimiter 1 to control data packing with a single character; enable both Delimiter 1 and 2 to control data packing with two characters received in sequence. When these fields are enabled, serial data will accumulate in the serial port's buffer until the buffer is full or until the specified delimiter character(s) are received. For example, the carriage-return character could be used as a delimiter in order to transmit each sentence or paragraph in a separate packet. Data will be packed according to the Delimiter process.
	Delimiters must be incorporated into the data stream at the software or device level.

ATTENTION

When Delimiter 1 is enabled, Packet length must be set to 0.

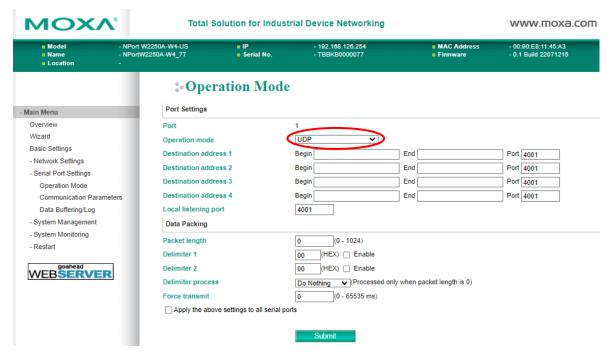

Delimiter Process

Default	Do Nothing
Options	Do Nothing, Delimiter + 1, Delimiter + 2, Strip Delimiter
Description	This field specifies how data is packed when delimiter characters are received. This field has no effect if Delimiter 1 is not enabled.
	Do nothing: Data accumulated in the serial port's buffer will be packed, including delimiters.
	Delimiter + 1: One additional character must be received before the data in the serial port's buffer is packed.
	Delimiter + 2: Two additional characters must be received before the data in the serial port's buffer is packed.
	Strip Delimiter: Data accumulated in the serial port's buffer will be packed, but the delimiter character(s) will be stripped from the data.

Force Transmit

Default	0 ms
Options	0 to 65535
Description	This field controls data packing by the amount of time that elapses between bits of data.
	When using this field, make sure that Inactivity time is disabled or set to a larger value. Otherwise, the connection may be closed before the data in the buffer can be transmitted.
	0: If serial data is not received, the NPort will wait indefinitely for additional data.
	1 to 65535: If serial data is not received for the specified amount of time, the data that is currently in the buffer will be packed for network transmission. The optimal force transmit time depends on your application, but it must be at least larger than one character interval within the specified baudrate. For example, assume that the serial port is set to 1200 bps, 8 data bits, 1 stop bit, and no parity. In this case, the total number of bits needed to send a character is 10 bits, and the time required to transfer one character is 8.3 ms, so the
	force transmit time must be larger than 8.3 ms.

Settings for UDP Mode

When **Operation Mode** is set to **UDP** on a serial port's **Operation Modes** page, configure additional settings such as **Destination address 1** through **4**, **Local listen port**, **Packet length, Delimiter 1**, **Delimiter 2**, **Delimiter process**, and **Force transmit**.

Destination Address 1 to 4

Default	
Options	IP address range and port (e.g., "192.168.1.1" to "192.168.1.64" and "4001")
Description	In UDP mode, you may specify up to four ranges of IP addresses for the serial port to connect to. At least one destination range must be provided.
	The maximum selectable IP address range is 64 addresses. However, you can enter multicast addresses in the Begin field, in the form xxx.xxx.xxx.255. For example, enter "192.127.168.255" to allow the NPort to broadcast UDP packets to all hosts with IP addresses between 192.127.168.1 and 192.127.168.254.

Local Listen Port

Default	4001
Options	
Description	This field specifies the UDP port that the NPort listens to and that other devices must use
	to contact the attached serial device.

Packet Length

Default	0
Options	0 to 1024
Description	This field specifies the maximum amount of data that is allowed to accumulate in the serial port buffer before sending. O: Packet length is disregarded and data in the buffer will be sent as specified by the delimiter settings or when the buffer is full.
	1 to 1024: Data in the buffer will be sent as soon it reaches the specified length.

Delimiter 1 and 2

Default	Disabled
Options	Disabled, Enabled, 00 to FF
Description	These fields are used to define special delimiter character(s) for data packing. Enable Delimiter 1 to control data packing with a single character; enable both Delimiter 1 and 2 to control data packing with two characters received in sequence.
	When these fields are enabled, serial data will accumulate in the serial port's buffer until the buffer is full or until the specified delimiter character(s) are received. For example, the carriage return character could be used as a delimiter in order to transmit each sentence or paragraph in a separate packet. Data will be packed according to the Delimiter process.
	Delimiters must be incorporated into the data stream at the software or device level.

ATTENTION

When **Delimiter 1** is enabled, **Packet length** must be set to 0.

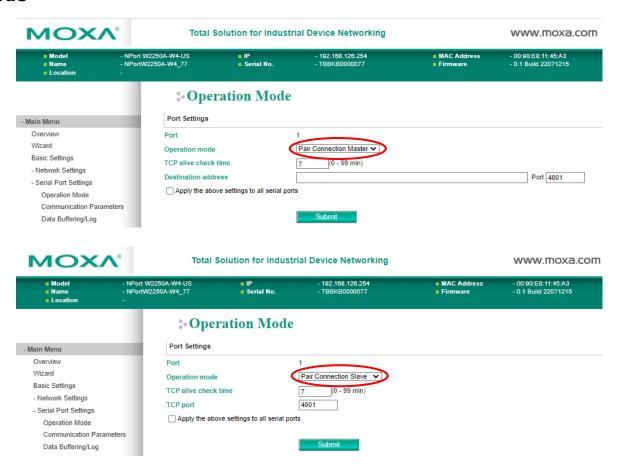

Delimiter Process

Default	Do Nothing
Options	Do Nothing, Delimiter + 1, Delimiter + 2, Strip Delimiter
Description	This field specifies how data is packed when delimiter characters are received. This field has no effect if Delimiter 1 is not enabled.
	Do nothing: Data accumulated in the serial port's buffer will be packed, including delimiters.
	Delimiter $+\ 1$: One additional character must be received before the data in the serial port's buffer is packed.
	Delimiter + 2: Two additional characters must be received before the data in the serial port's buffer is packed.
	Strip Delimiter: Data accumulated in the serial port's buffer will be packed, but the delimiter character(s) will be stripped from the data.

Force Transmit

Default	0 ms
Options	0 to 65535
Description	This field controls data packing by the amount of time that elapses between bits of data. When using this field, make sure that Inactivity time is disabled or set to a larger value. Otherwise, the connection may be closed before the data in the buffer can be transmitted.
	0: If serial data is not received, the NPort will wait indefinitely for additional data.
	1 to 65535: If serial data is not received for the specified amount of time, the data that is currently in the buffer will be packed for network transmission. The optimal force transmit time depends on your application, but it must be at least larger than one character interval within the specified baudrate. For example, assume that the serial port is set to 1200 bps, 8 data bits, 1 stop bit, and no parity. In this case, the total number of bits needed to send a character is 10 bits, and the time required to transfer one character is 8.3 ms, so the force transmit time must be larger than 8.3 ms.

Settings for Pair Connection Master Mode and Pair Connection Slave Mode

When **Operation Mode** is set to **Pair Connection Master** or **Pair Connection Slave** on a serial port's **Operation Modes** page, configure additional settings such as **TCP alive check time**, **Destination address** and **TCP port.** A Pair Connection application involves one serial port communicating over an IP network to another serial port as if a serial cable connected the two serial ports. Pair Connection modes can extend RS-232 transmission to unlimited distances.

An NPort device server is needed at both ends of the connection. The serial port at one end must be set to Pair Connection Master mode, and the serial port at the other end must be set to Pair Connection Slave mode. It does not matter which serial port is master and which serial port is slave.

TCP Alive Check Time

Default	7 min
Options	0 to 99 min
Description	This field specifies how long the NPort will wait for a response to "keep-alive" packets before closing the TCP connection. The NPort checks connection status by sending periodic "keep-alive" packets. 0: The TCP connection will remain open even if there is no response to the "keep-alive" packets.
	1 to 99: If the remote host does not respond to the packet within the specified time, the NPort will force the existing TCP connection to close.

Destination Address

Default	
Options	IP address and port (e.g., "192.168.1.1" and "4001")
Description	This field specifies the IP address for the NPort at the opposite end of the Pair Connection,
	and the TCP port number for communication with the serial port. The port number must
	match with that serial port's TCP port setting.

TCP Port

Default	4001
Options	
Description	This field specifies the TCP port to use for communication with the attached serial device.
	The serial port at the opposite end of the Pair Connection must use this port number to
	establish the connection.

Settings for Ethernet Modem Mode

When **Application** is set to **Ethernet Modem Mode**, the NPort will accept AT commands such as "ATD 192.127.168.1:4001" from the serial port. A TCP connection will then be requested from the specified remote Ethernet Modem or PC. When the remote unit accepts this TCP connection, the NPort will return the "**CONNECT** {baudrate}" signal to the serial port and will then enter data mode. Please refer to Appendix C for details on Ethernet modem commands.

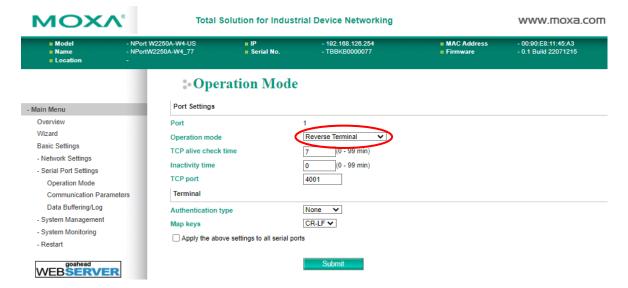

TCP Alive Check Time

Default	7 min
Options	0 to 99 min
Description	This field specifies how long the NPort will wait for a response to "keep-alive" packets before closing the TCP connection. The NPort checks connection status by sending periodic "keep-alive" packets. 0: The TCP connection will remain open even if there is no response to the "keep-alive" packets.
	1 to 99: If the remote host does not respond to the packet within the specified time, the NPort will force the existing TCP connection to close.

TCP Port

Default	4001
Options	
Description	This field specifies the TCP port to use for communication with the attached serial device.

Settings for Reverse Terminal Mode

TCP alive check time (default=7 min): This field specifies how long the NPort W2150A-W4/W2250A-W4 will wait for a response to keep-alive packets before closing the TCP connection. The NPort W2150A-W4/W2250A-W4 checks the connection status by sending keep-alive packets periodically. If the remote host does not respond to the packet within the time specified in this field, the NPort W2150A-W4/W2250A-W4 will force the existing TCP connection to close. For socket and device control modes, the NPort W2150A-W4/W2250A-W4 will listen for another TCP connection from another host after closing the connection. If the TCP alive check time is set to 0, the TCP connection will remain open even if there is no response to the keep-alive packets.

Inactivity time (default=0 min): This field specifies the idle time setting for auto-disconnection. A setting of 0 min, will cause the port to remain connected even when idling.

TCP port (default=4001): This is the TCP port number assignment for the serial port on the NPort W2150A-W4/W2250A-W4. It is the port number that the serial port uses to listen to connections and that other devices must use to contact the serial port. To avoid conflict with well-known TCP ports, the default is set to 4001.

Authentication type (default=None): This field allows you to configure the method used, if any, to verify a user's ID and authorization.

Option	Description
None	Authentication is not required
Local	Verify the ID against the NPort W2150A-W4/W2250A-W4 User Table.
RADIUS	Verify the ID against the external RADIUS server.

Try next type on authentication denied (default=Disable): This field enables or disables the system to try the next type if the first authentication is denied.

Map keys <CR-LF> (default=CR-LF): This specifies how the **ENTER** key is mapped from the Ethernet port through the serial port.

Option	Description	
<cr-lf></cr-lf>	Carriage return + line feed (i.e., the cursor will jump to the next line and return to the first	
<cr-lf></cr-lf>	character of the line)	
<cr></cr>	Carriage return (i.e., the cursor will return to the first character of the line)	
<lf></lf>	Line feed (i.e., the cursor will jump to the next line, but not move horizontally)	

Communication Parameters

The **Communication Parameters** page for each serial port is where serial communication settings are specified, such as **Baud rate**, **Data bits**, and **Stop bits**.

Alias

Default			
Options	free text (e.g., "Secondary console connection")		
Description	This is an optional free text field to help you differentiate one serial port from another. It		
	does not affect the operation of the NPort device server.		

ATTENTION

Serial communication settings should match the attached serial device. Check the communication settings in the user's manual for your serial device.

Baud Rate

Default	115200
Options	300, 600, 1200, 1800, 2400, 4800, 9600, 19200, 38400, 57600, 115200, 230400,
	460800, 921600, Other
Description	This field specifies the baudrate for the serial port. Nonstandard baudrates are supported through the Other setting. When set to Other , you may manually enter a baudrate of your choice, up to 921600.
	300 to 921600: The serial port will operate at the specified baudrate.
	Other: The serial port will operate at a baudrate that is manually entered by the user.

Parity

Default	None		
Options	None, Odd, Even, Space, Mark		
Description	This field specifies the type of parity bit used for each character frame.		

Data Bit

Default	8			
Options	5, 6, 7, 8			
Description	This field specifies the number of data bits used to encode each character of data.			

Stop Bit

Default	1
Options	1, 1.5, 2
Description	This field specifies the number of stop bits used for each character frame.

Flow Control

Default	RTS/CTS		
Options	None, RTS/CTS, XON/XOFF		
Description	This field specifies the type of flow control used by the serial port.		

FIFO

Default	Enable	
Options	Enable, Disable	
Description	This field specifies whether the serial port will use the built-in FIFO. A 128-byte FIFO is	
	provided to each serial port for both Tx and Rx directions. To prevent data loss during	
	serial communication, this should be set to Disabled if the attached serial device does not	
	have a FIFO.	

Interface

Default	RS-232		
Options	RS-232, RS-422, RS-485 2-wire, RS-485 4-wire		
Description	This field specifies the type of interface the serial port will use.		

Data Buffering/Log

On the serial port's **Data Buffering/Log** page, you can enable or disable **Port buffering** and **Serial data logging**.

Port Buffering

Default	Disable	
Options	Enable, Disable	
Description	This field specifies whether the serial port will use port buffering when the network	
	connection (Ethernet or WLAN) is down. Port buffering can be used in Real COM mode, TCP	
	Server mode, TCP Client mode, and Pair Connection mode. For other modes, the port	
	buffering settings will have no effect.	

Serial Data Logging(64K)

Default	Disable
Options	Enable, Disable
Description	This field specifies whether data logs for the serial port will be stored on system RAM. Each serial port is allotted 64 KB for data logging. The data log is not saved when the NPort is powered off.

9. Web Console: System Management

Overview

This chapter explains how to configure all settings located under the **System Management** folder in the NPort web console.

System Management

Misc. Network Settings

Accessible IP List

The **Accessible IP List** page is located under **Misc. Network Settings** in the **System Management** folder. This page is used to restrict access to the NPort by IP address. Only IP addresses on the list will be allowed access to the NPort. You may add a specific address or range of addresses by using a combination of IP address and netmask, as follows:

To allow access to a specific IP address

Enter the IP address in the corresponding field; enter 255.255.255.255 for the netmask.

To allow access to hosts on a specific subnet

For both the IP address and netmask, use 0 for the last digit (e.g., "192.168.1.0" and "255.255.255.0").

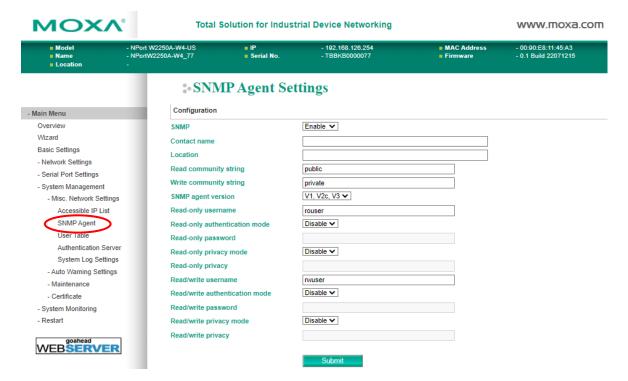

To allow access to all IP addresses

Make sure that **Enable the accessible IP list** is not checked.

Refer to the following table for more configuration examples.

Desired IP Range	IP Address Field	Netmask Field
Any host	Disable	Disable
192.168.1.120	192.168.1.120	255.255.255.255
192.168.1.1 to 192.168.1.254	192.168.1.0	255.255.255.0
192.168.0.1 to 192.168.255.254	192.168.0.0	255.255.0.0
192.168.1.1 to 192.168.1.126	192.168.1.0	255.255.255.128
192.168.1.129 to 192.168.1.254	192.168.1.128	255.255.255.128

SNMP Agent Settings

The **SNMP Agent** page is located under **Misc. Network Settings** in the **System Management** folder. This page is used to configure the SNMP Agent on the NPort.

SNMP

Default	Enable
Options	Enable, Disable
Description	This field enables or disables the SNMP Agent. If enabled, you will need to configure other
	SNMP Agent settings. You will need to enter a community name under Read community
	string.

Contact Name

Default	
Options	free text (e.g., "J Smith")
Description	This is an optional free text field that can specify the SNMP emergency contact name,
	telephone, or pager number.

Location

Default	
Options	free text (e.g., "Building XYZ")
Description	This is an optional free text field that can specify the location for SNMP agents, such as the
	NPort.

Read Community String

Default	public
Options	free text (e.g., "public community")
Description	This field specifies the read community string used for the SNMP Agent. This is a text password mechanism that is used to weakly authenticate queries to agents of managed network devices.

Write Community String

Default	Private
Options	free text (e.g., "private community")
Description	This field specifies the write community string used for the SNMP Agent. This is a text
	password mechanism that is used to weakly authenticate changes to agents of managed
	network devices.

SNMP Agent Version

Default	V1, V2c, V3
Options	V1, V2c, V3 / V1, V2c / V3 only
Description	This field specifies which version(s) of SNMP to support.

Read Only Username

Default	Rouser
Options	free text (e.g., "guest")
Description	This field specifies a username to use for read-only access.

Read Only Authentication Mode

Default	Disable
Options	Disable, MD5, SHA
Description	This field specifies the type of authentication to use for read-only access.

Read Only Password

Default	
Options	Free text (e.g., "password123")
Description	This field specifies the password that users must enter for read-only access, if read-only
	authentication is enabled.

Read Only Privacy Mode

Default	Disable
Options	Disable
Description	This field specifies whether data encryption will be used during read-only access.

Read Only Privacy

Default	
Options	Free text (e.g., "read only key")
Description	This field specifies the encryption key for read-only access, if read-only privacy is enabled.

Read/Write Username

Default	rwuser
Options	free text (e.g., "admin")
Description	This field specifies a username to use for read/write access.

Read/Write Authentication Mode

Default	Disable
Options	Disable, MD5, SHA
Description	This field specifies the type of authentication to use for read/write access.

Read/Write Password

Default	
Options	Free text (e.g., "password123")
Description	This field specifies the password that users must enter for read/write access, if read-only
	authentication is enabled.

Read/Write Privacy Mode

Default	Disable
Options	Disable, DES, AES
Description	This field specifies whether data encryption will be used during read/write access.

Read/Write Privacy

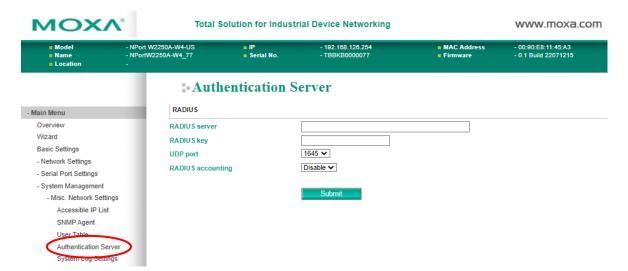

Default	
Options	free text (e.g., "read write key")
Description	This field specifies the encryption key for read/write access, if read-/write privacy is
	enabled.

User Table

The NPort User Table can authenticate users for reverse terminal access and is useful if you do not have an external RADIUS server for authentication. The NPort User Table stores up to 64 entries, with fields for User Name and Password.

Authentication Server

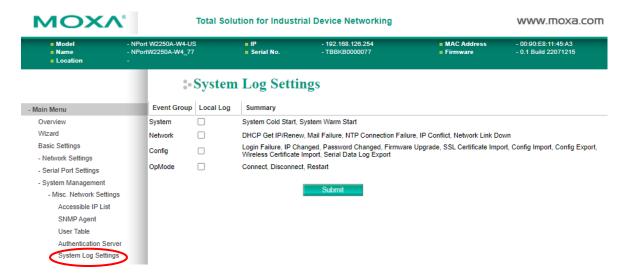

RADIUS server: If you are using a RADIUS server for user authentication, enter its IP address here.

RADIUS key: If you are using a RADIUS server for user authentication, enter its password here.

UDP port (default=1645): Please select which UDP port your RADIUS server is using to communicate. The device supports UDP port 1645 or 1812.

RADIUS accounting: Use this field to enable or disable RADIUS accounting.

System Log Settings

The **System Log** page is located under **Misc. Network Settings** in the **System Management** folder. This is where you select the type of events that will be logged by the NPort.

Group	Event
System	System Cold Start, System Warm Start
Network	DHCP, Get IP/Renew, Mail Fail, NTP Connect Fail, IP Conflict, Network Link Down
II Ontid	Login Fail, IP Changed, Password Changed, Firmware Upgrade, SSL Certificate Import,
	Config Import, Config Export, Wireless Certificate Import, Serial Data Log Export
Op Mode	Connect, Disconnect, Restart

Auto Warning Settings

Event Settings

The **Event Settings** page is located under **Auto Warning Settings** in the **System Management** folder. This is where you specify how the NPort will notify you of system and configuration events. Depending on the event, different options for notification are available, as shown above. **Mail** refers to sending an e-mail to a specified address. **Trap** refers to sending an SNMP trap.

Event	Description
Cold start	The NPort was powered on or was restarted after a firmware upgrade.
Warm start	The NPort restarted without powering off.
Console login auth fail	An attempt has been made to open the web, Telnet, or serial console, but the
Console logili autii iali	password was incorrect.
IP changed	The IP address has been changed.
Password changed	The password to the console has been changed.

Serial Event Settings

The **Serial Event Settings** page is located under **Auto Warning Settings** in the **System Management** folder. This is where you specify how the NPort will notify you of DCD and DSR events for each serial port. **Mail** refers to sending an e-mail to a specified address. **Trap** refers to sending an SNMP trap.

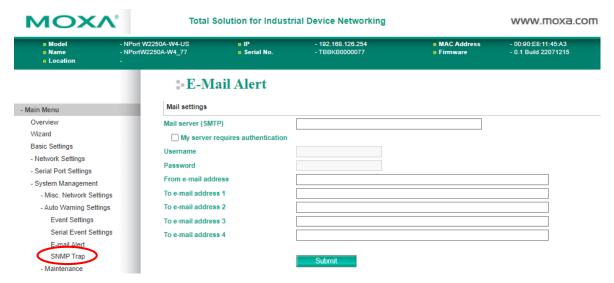

A change in the DCD (Data Carrier Detect) signal shows that the modem connection status has changed. If the DCD signal changes to low, it shows that the connection line is down. A change in the DSR (Data Set Ready) signal shows that the data communication equipment is powered off. If the DSR signal changes to low, it shows that the data communication equipment is powered down.

ATTENTION

SNMP shows a change in DCD or DSR signals, but does not differentiate between the two. A change in either signal from -" to +" is showed by "link up" and a change in either signal from +" to -" is showed by "link down."

E-mail Alert

The **E-mail Alert** page is located under **Auto Warning Settings** in the **System Management** folder. This is where you specify how and where e-mail is sent when e-mail is used for automatic notification of system and serial port events.

ATTENTION

Consult your network administrator or ISP for the mail server settings to use for your network. If these settings are not configured correctly, e-mail notification may not work properly.

Mail Server (SMTP)

Default	
Options	Free text (e.g., "192.168.3.3")
Description	This field specifies the IP address of the mail server that will be used when sending
	automatic warning e-mails. If the mail server requires authentication, select My server
	requires authentication and enter the username and password.

From E-mail Address

Default	
Options	Free text (e.g., "jsmith@xyz.com")
Description	This field specifies the e-mail address that will be listed in the e-mail's From field.

To E-mail Address 1 to 4

Default	
Options	Free text (e.g., "admin@abc.com")
Description	These fields specify the destination e-mail address(es) for the automatic e-mail warnings.

SNMP Trap

The **SNMP Trap** page is located under **Auto Warning Settings** in the **System Management** folder. This is where you specify the SNMP trap settings to use for automatic notification of system and serial port events.

SNMP Trap Server IP

Default	
Options	IP address (e.g., "192.168.5.5")
Description	This field specifies the IP address of the SNMP trap server that will receive SNMP traps.

Trap Version

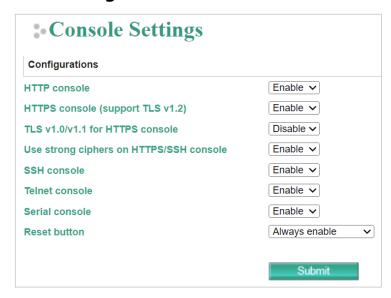

Default	v1
Options	v1, v2c
Description	This field specifies the SNMP trap version to use.

Trap Community

Default	
Options	Free text (e.g., "public access")
Description	This field specifies the SNMP trap community.

Maintenance

Console Settings

The **Console Settings** page is located under **Maintenance** in the **System Management** folder. This is where you enable or disable access to the various NPort configuration consoles, as well as the behavior of the reset button. You may change **HTTP console**, **HTTPS console** (support TLS v1.2), TLS v1.0/v1.1 for HTTPS console, Use strong ciphers on HTTPS/SSH console, SSH console, Telnet console, Serial console, and Reset button.

HTTP Console

Default	Enable
Options	Enable, Disable
Description	This field enables or disables access to the HTTP (web) console.

HTTPS Console (supports TLS v1.2)

Default	Enable
Options	Enable, Disable
Description	This field enables or disables access to the HTTPS (web) console.

TLS v1.0/v1.1 for HTTPS Console (For Firmware V1.4 and later versions)

Default	Disable	
Options	Enable, Disable	
Description	This setting is to enable the TLS $v1.0/v1.1$ version with an HTTPS connection for backward	
	compatibility with an outdated browser. We don't recommend enabling it.	

Using Strong Ciphers on HTTPS/SSH Console (For Firmware V1.4 and later versions)

Default	Enable
Options	Enable, Disable
Description	When this feature is enabled, insecure ciphers, including SHA1 and MD5, will be removed.

SSH Console

Default	Enable
Options	Enable, Disable
Description	This field enables or disables access to the SSH console.

Telnet Console

Default	Enable
Options	Enable, Disable
Description	This field enables or disables access to the Telnet console.

Serial Console

Default	Enable
Options	Enable, Disable
Description	This field enables or disables access to the serial console.

Reset Button

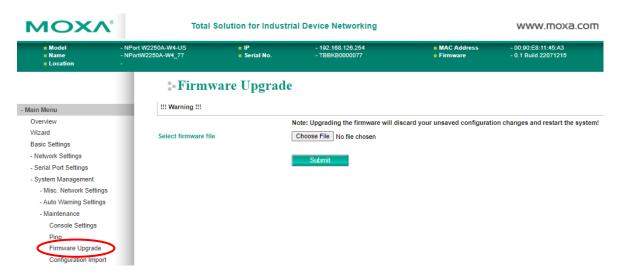

Default	Always Enable		
Options	Always Enable, Disable after 60 sec.		
Description	This field specifies the behavior of the hardware reset button.		
	Always Enable: The reset button will operate as usual.		
	Disable after 60 sec: The reset button will only be effective for the first 60 seconds that the		
	NPort is powered on.		

Ping

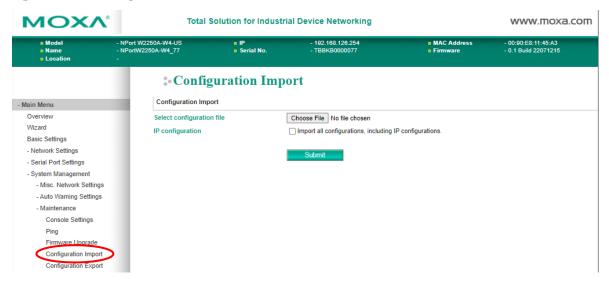

The **Ping** page is located under **Maintenance** in the **System Management** folder. It provides a convenient way to test an Ethernet connection or verify an IP address. Enter the IP address or domain name in the Destination field and click **[Activate]**. The results will be displayed immediately.

Firmware Upgrade

The **Firmware Upgrade** page is located under **Maintenance** in the **System Management** folder. This is where you can update the NPort firmware. After obtaining the latest firmware from www.moxa.com, select or browse for the firmware file in the **Select firmware file** field. Before clicking **[Submit]**, save the NPort configuration using the **Configuration Export** page, since the firmware upgrade process may cause all settings to revert to factory defaults.

Configuration Import

The **Configuration Import** page is located under **Maintenance** in the **System Management** folder. This is where you can load a previously saved or exported configuration. Select or browse for the configuration file in the **Select configuration file** field. If you also wish to import the IP configuration (i.e., IP address, netmask, and gateway), make sure that **Import all configurations including IP configurations** is checked.

ATTENTION

You may import the existing configuration file of the NPort W2x50A Series to facilitate the process. Please note:

- 1. If your NPort W2x50A Series is configured as BOOTP of the IP configuration (Web console: under **Network Settings > Ethernet/Bridge Settings**), it will be DHCP instead.
- If your NPort W2x50A Series is configured as Ad-hoc Mode of the Network type (Web console: under Network Settings > WLAN Settings > Profile), it will be Infrastructure Mode.
- If your NPort W2x50A Series is configured less than 300 baudrate (Web console: Serial Port Settings > Communication Parameters), it will be 300.

NOTE

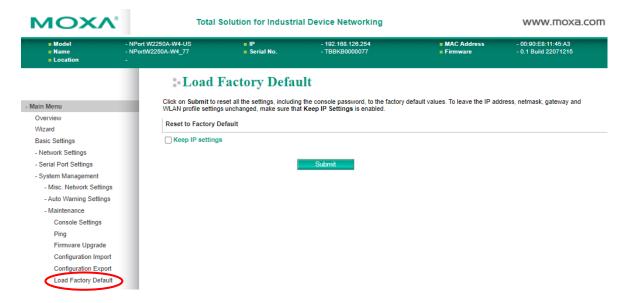

The NPort W2x50A-W4 Series configuration file cannot be imported to the NPort W2x50A Series for use.

Configuration Export

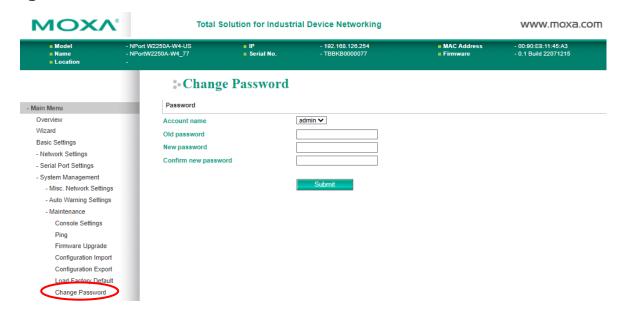

The **Configuration Export** page is located under **Maintenance** in the **System Management** folder. This is where you can save the NPort's current configuration to a file on the local host. Click **[Download]** to begin the process. A window should appear asking you to open or save the configuration text file.

Load Factory Default

The **Load Factory Default** page is located under **Maintenance** in the **System Management** folder. Click **[Submit]** to reset all settings to the factory defaults. You can preserve the NPort's existing IP settings (i.e., IP address, netmask, gateway, WLAN profile, and all certificates) by making sure **Keep IP settings** is checked before clicking **[Submit]**.

Change Password

The **Change Password** page is located under **Maintenance** in the **System Management** folder. To change the password, choose the account name first, and then enter the old password in the **Old password** field. Enter the new password twice, once in the **New password** field and once in the **Confirm password**. Leave these fields blank to remove password protection.

ATTENTION

If you forget the password, the ONLY way to configure the NPort is by loading the factory defaults with the reset button. All settings will be lost.

Before setting the password, you may want to first export the configuration to a file. Your configuration can then be easily imported back into the NPort if necessary.

Certificate

Ethernet SSL Certificate Import

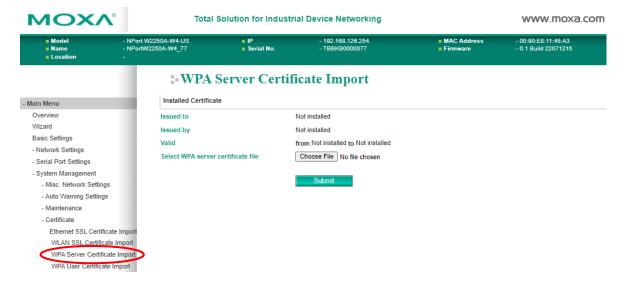

The **Ethernet SSL Certificate Import** page is located under **Certificate** in the **System Management** folder. This is where you can load the Ethernet SSL certificate. Select or browse for the certificate file in the **Select SSL certificate/key file** field. The NPort only supports the PEM format of the certificate so far. If your file is in another format, for example DER or PFX, please convert it to PEM first.

WLAN SSL Certificate Import

The **WLAN SSL Certificate Import** page is located under **Certificate** in the **System Management** folder. By default, the WLAN SSL certificate is automatically generated by the NPort based on the IP address of the wireless interface. You can also import a certificate. Select or browse for the certificate file in the **Select SSL certificate/key file** field.

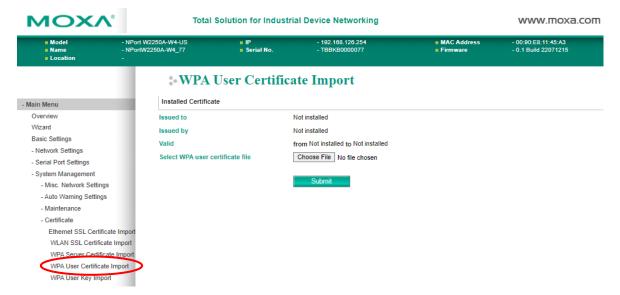

WPA Server Certificate Import

The **WPA Server Certificate Import** page is located under **Certificate** in the **System Management** folder. This is where you can load the WPA server certificate. Select or browse for the certificate file in the **Select WPA server certificate file** field.

You must install the trusted server certificate from the RADIUS server in order to enable **Verify server certificate** in the WLAN **Security** settings. This certificate will then be used by the NPort to authenticate the RADIUS server.

WPA User Certificate Import

The **WPA User Certificate Import** page is located under **Certificate** in the **System Management** folder. This is where you can load the WPA user certificate. Select or browse for the certificate file in the **Select WPA user certificate file** field.

The user certificate of the NPort must be installed in the RADIUS server when the NPort uses WPA (WPA2)/TLS. The trusted server certificate of the RADIUS server must also be installed in the NPort.

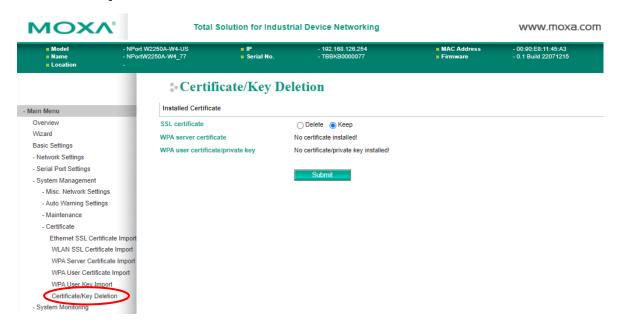

WPA User Key Import

The **WPA User Key Import** page is located under **Certificate** in the **System Management** folder. This is where you can load the WPA user certificate. Select or browse for the user's private key file in the **Select WPA user privacy key file** field and enter the **Password for the private key**.

The user private key of the NPort must be installed on the RADIUS server when the NPort uses WPA(WPA2)//TLS. The trusted server certificate of RADIUS server must also be installed on the NPort.

Certificate/Key Delete

The **Certificate/Key Delete** page is located under **Certificate** in the **System Management** folder. This page is where you can delete certificates or WPA keys that have been installed on the model. When you click **[Submit]**, any certificate or key that has been set to **Delete** will be deleted from the NPort.

10. Web Console: System Monitoring

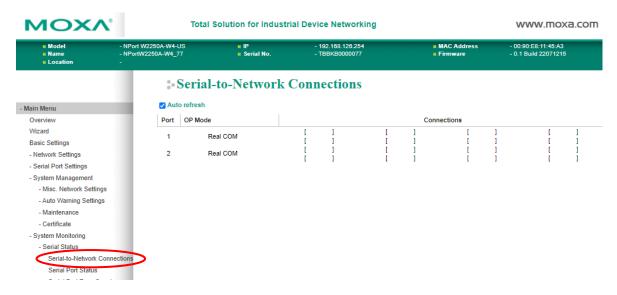

Overview

This chapter explains how to use the **System Monitoring** functions on the NPort web console. These functions allow you to monitor many aspects of your operation.

System Monitoring

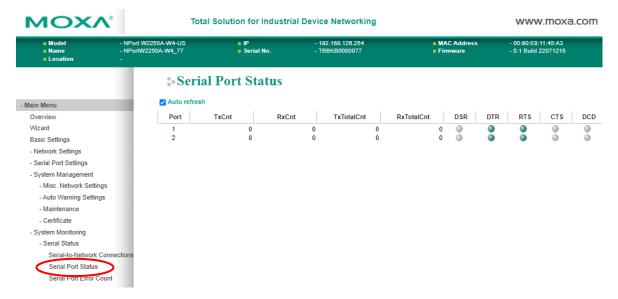

Serial Status

Serial to Network Connections

The **Serial to Network Connections** page is located under **Serial Status** in the **System Monitoring** folder. On this page, you can monitor the current operation mode and host connection status for each serial port.

Serial Port Status

The **Serial Port Status** page is located under **Serial Status** in the **System Monitoring** folder. On this page, you can monitor the signal and data transmission status for each serial port.

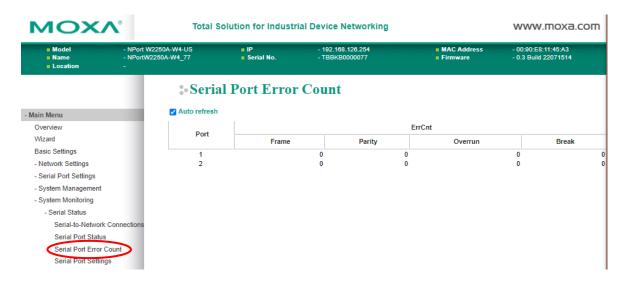

TxCnt: number of Tx packets (to device) for the current connection

RxCnt: number of Rx packets (from device) for the current connection

TxTotalCnt: number of Tx packets since the NPort was powered on

RxTotalCnt: number of Rx packets since the NPort was powered on

Serial Port Error Count

The **Serial Port Error Count** page is located under **Serial Status** in the **System Monitoring** folder. On this page, you can view the current number of frame, parity, overrun, and break errors for each serial port.

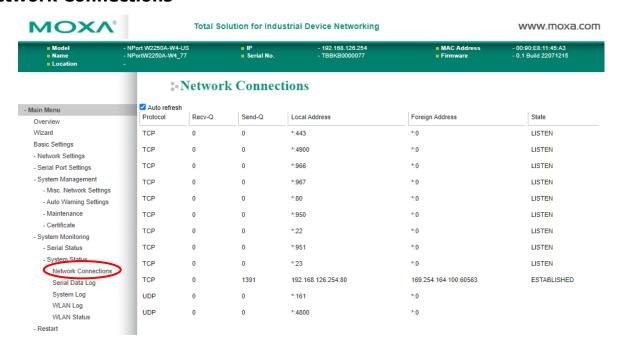

Serial Port Settings

The **Serial Port Settings** page is located under **Serial Status** in the **System Monitoring** folder. On this page, you can view the current communication settings for each serial port.

System Status

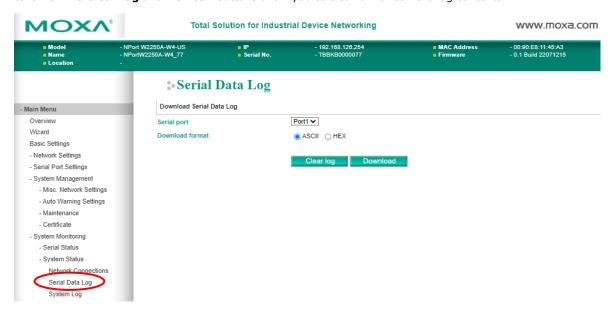

Network Connections

The **Network Connections** page is located under **System Status** in the **System Monitoring** folder. On this page, you can view the status of any network connection to the NPort.

Serial Data Log

Data logs for each serial port can be viewed in ASCII or HEX format. After selecting the serial port and format, you may click **Select** all to select the entire log if you wish to copy and paste the contents into a text file. The **Clear log** and **Refresh** buttons allow you to clear or refresh the log contents.

The **Serial Data Log** page is located under **System Status** in the **System Monitoring** folder. This is where you can download the current data log for a serial port. Select the desired serial port in the **Select port** field. Select the desired data format in the **Download format** field. Click **[Clear log]** to clear the log contents.

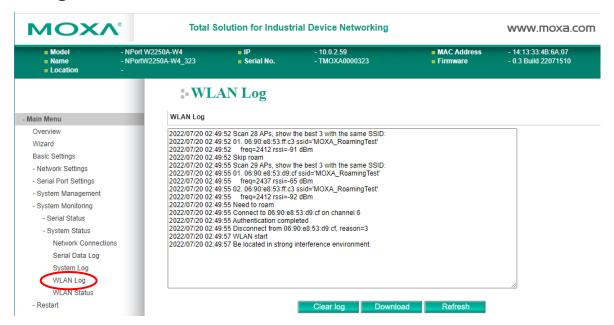

The data log includes all data sent or received by the specified serial port since the NPort was powered on. The maximum size of the log is 64 KB.

System Log

The **System Log** page is located under **System Status** in the **System Monitoring** folder. This is where you can view the log of NPort system events. Click **[Clear log]** to clear the log contents. Click **[Refresh]** to refresh the log contents.

WLAN Log

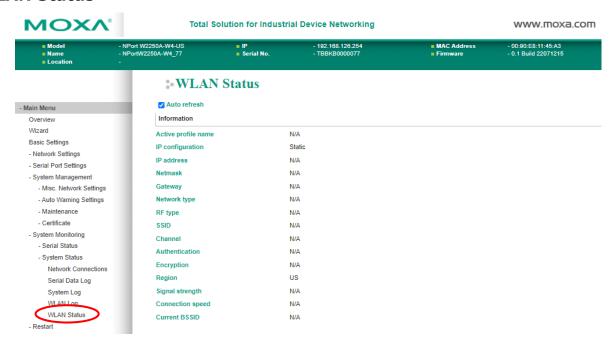

The **WLAN Log** page is located under **System Status** in the **System Monitoring** folder. This is where you can view the log between the device server and the access points. It's an excellent tool for an engineer to troubleshoot if there is any issue with the wireless connection. To clear the log contents, click **[Clear log]**. Click **[Download]** to save the log to a txt file for an engineer to troubleshoot, e.g., Moxa's Technical Support Team. Click **[Refresh]** to refresh the log contents.

NOTE

The WLAN log is for R&D analysis. If you encounter a wireless problem, please provide the WLAN log and topology for MOXA diagnostic purposes.

WLAN Status

The **WLAN Status** page is located under **System Status** in the **System Monitoring** folder. This is where you can view the current WLAN settings and status.

11. Web Console: Restart

Overview

This chapter explains how to save your configuration changes and restart the NPort using the NPort web console. Configuration changes will not be effective until they are saved, and the NPort is rebooted.

Restart

Restart System

The **Restart System** page is in the **Restart** folder. Click **[Restart]** to restart the NPort, and the new settings will take effect upon restart.

Restart Ports

The **Restart Ports** page is in the **Restart** folder. Select the desired serial and click **[Select All]** to select all serial ports. Click **[Submit]** to restart the selected serial ports.

12. Android API Instructions

Overview

If you want to remote control your serial devices on an Android platform, then the MxNPortAPI is a simple application programming tool you can use. The MxNPortAPI helps programmers develop an Android application to access the device server by TCP/IP.

The MxNPortAPI provides frequently used serial command sets like port control, input/output, etc., and the style of developed Android application is similar to MOXA Driver Manager. For more details about the provided functions, please refer to the "MxNPortAPI Function Groups" section.

This MxNPortAPI is layered between the Android application and Android network manager framework. This Android library is compatible with Java 1.7, Android 3.1 (Honeycomb - API version 12), and later versions.

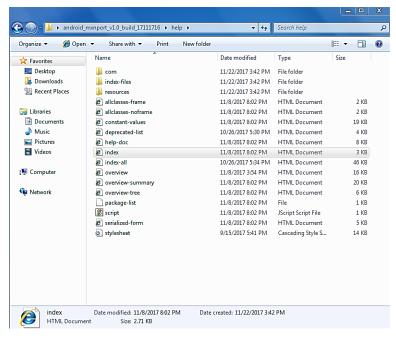

How to Start MxNPortAPI

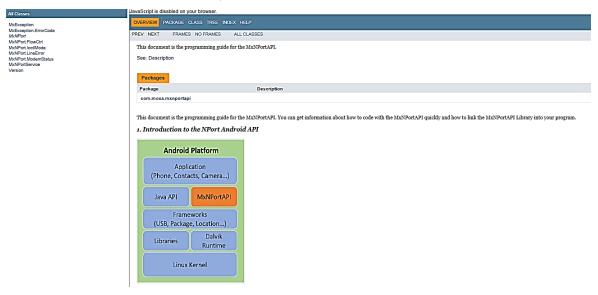

You can download the MxNPortAPI from Moxa's website at http://www.moxa.com, and develop the application program in popular OSs, such as Windows, Linux, or Mac.

(You can refer the Android studio website to see the system requirements for the development environment: https://developer.android.com/studio/index.html?hl=zh-tw#Requirements).

To start your application program, please unzip the MxNPortAPI file and refer to the index (.html) under the Help directory.

For more details about the installation, please refer to the Overview section.

MxNPortAPI Function Groups

The supported functions in this API are listed below:

Port Control	Input/Output	Port Status Inquiry	Miscellaneous
open			
close		getBaud	
setIoctlMode		getFlowCtrl	
setFlowCtrl	read	getIoctlMode	co+Prople
setBaud	write	getLineStatus	setBreak
setRTS		getModemStatus	
setDTR		getOQueue	
flush			

Example Program

To make sure this API is workable with the device server on an Android platform, see the example program below:

```
Thread thread = new Thread()
@Override
public void run() {
      /* Enumerate and initialize NPorts on system */
      List<MxNPort> NPortList = MxNPortService.getNPortInfoList();
      if(NPortList!=null){
               MxNPort.IoctlMode mode = new MxNPort.IoctlMode();
               mode.baudRate = 38400;
               mode.dataBits = MxNPort.DATA_BITS_8;
               mode.parity = MxNPort.PARITY NONE;
               mode.stopBits = MxNPort.STOP_BITS_1;
               MxNPort mxNPort = NPortList.get(0); /* Get first NPort device */
                       byte[] buf = {'H','e','l','l','o',' ','W','o','r','l','d'};
                       mxNPort.open(); /*open port*/
                       mxNPort.setIoctlMode(mode); /*serial parameters setting*/
                       mxNPort.write(buf, buf.length); /*write data*/
                       mxNPort.close(); /*close port*/
               } catch (MxException e){
                       /*Error handling*/
               }
         }
thread.start();
```

A. SNMP Agents with MIB II & RS-232-Like Groups

The NPort has built-in SNMP (Simple Network Management Protocol) agent software that supports SNMP Trap, RFC1317 RS-232 like groups and RFC 1213 MIB-II. The following table lists the standard MIB-II groups, as well as the variable implementation for the NPort.

RFC1213 MIB-II Supported SNMP Variables

B. Well-known Port Numbers

Listed below are Well-known Port Numbers that may cause network problems if they are assigned to an NPort serial port. Refer to RFC 1700 for Well-known Port Numbers or refer to the following introduction from IANA.

The port numbers are divided into three ranges: Well-known Ports, Registered Ports, and Dynamic and/or Private Ports.

- Well-known Ports range from 0 through 1023.
- **Registered Ports** range from 1024 through 49151.
- **Dynamic and/or Private Ports** range from 49152 through 65535.

The Well-known Ports are assigned by IANA, and on most systems, can only be used by system processes or by programs executed by privileged users. The following table shows famous port numbers among the well-known port numbers. For more details, please visit the IANA website at http://www.iana.org/assignments/port-numbers.

TCP Socket	Application Service
0	reserved
1	TCP Port Service Multiplexor
2	Management Utility
7	Echo
9	Discard
11	Active Users (systat)
13	Daytime
15	Netstat
20	FTP data port
21	FTP CONTROL port
23	Telnet
25	Simple Mail Transfer Protocol (SMTP)
37	Time (Time Server)
42	Host name server (names server)
43	Whois (nickname)
49	Login Host Protocol (Login)
53	Domain Name Server (domain)
79	Finger protocol (Finger)
80	World Wide Web HTTP
119	Network News Transfer Protocol (NNTP)
123	Network Time Protocol
213	IPX
160 to 223	Reserved for future use

UDP Socket	Application Service
0	reserved
2	Management Utility
7	Echo
9	Discard
11	Active Users (systat)
13	Daytime
35	Any private printer server
39	Resource Location Protocol
42	Host name server (names server)
43	Whois (nickname)
49	Login Host Protocol (Login)
53	Domain Name Server (domain)
69	Trivial Transfer Protocol (TETP)
70	Gopher Protocol
79	Finger Protocol
80	World Wide Web HTTP
107	Remote Telnet Service
111	Sun Remote Procedure Call (Sunrpc)
119	Network News Transfer Protocol (NNTP)
123	Network Time Protocol (NTP)
161	(Simple Network Mail Protocol (SNMP)
162	SNMP Traps
213	IPX (Used for IP Tunneling)

C. Ethernet Modem Commands

A serial port on the NPort can be set to Ethernet Modem mode, allowing a PC or device to connect to the NPort as if it was an Ethernet modem. This section provides additional details about how the NPort operates in Ethernet Modem mode.

Dial-in Operation

The NPort can listen for a TCP/IP connection request from a remote Ethernet modem or host. The NPort's response depends on the ATSO value, as follows.

ATS0=0: The NPort will temporarily accept the TCP connection and then send the "**RING**" signal out through the serial port. The serial controller must reply with "**ATA**" within 2.5 seconds to accept the connection request, after which the NPort enters data mode. If no "**ATA**" command is received, the NPort will disconnect after sending three "**RING**" signals.

ATS0≥1: The NPort will accept the TCP connection immediately. It will send the "**CONNECT** {baudrate}" command to the serial port and will immediately enter data mode.

Dial-out

The NPort accepts ATD commands such as "ATD 192.168.1.1:4001" from the serial port. It will then request a TCP connection from the specified remote Ethernet modem or PC. Once the remote unit accepts this TCP connection, the NPort will send the "CONNECT {baudrate}" command to the serial port and will immediately enter data mode.

Disconnection Request from Local Site

When the NPort is in data mode, you can start disconnection by sending "+++". Some applications allow you to directly set the DTR signal to off, which will also start disconnection. The NPort will enter command mode, and you can then enter "ATH" to close the TCP connection "NO CARRIER" will be returned to the serial port.

ATTENTION

When entering "+++" to disconnect, the three "+" characters must be sent in quick succession, and the sequence must be prefaced and followed by a guard time to protect the raw data. You can change the disconnect character using register S2. You can set the guard time using register S12.

Disconnection Request from Remote Site

After the TCP connection has been closed by the remote Ethernet modem or PC, the NPort will send "NO CARRIER" to the serial port and will return to command mode.

AT Commands

Ethernet Modem mode supports the following common AT commands, as used with a typical modem:

No.	Command	Description	Remarks
1	ATA	Answer manually	
		Dial up specified IP address and port number	
2	ATD	ATD 192.168.1.1:950 (example)	
2	A.T.F.	ATE0=Echo OFF	
3	ATE	ATE1=Echo ON (default)	
4	ATH	ATH0=On-hook (default)	
4	АІП	ATH1=Off-hook	
5	ATI, ATIO,	Modem version	reply "OK" only
3	ATI1, ATI2	Modern version	Teply OK Only
6	ATL	Speaker volume option	reply "OK" only
7	ATM	Speaker control option	reply "OK" only
8	ATO	On line command	
9	ATP, ATT	Set Pulse/Tone Dialing mode	reply "OK" only
10	ATQ0, ATQ1	Quiet command (default=ATQ0)	
11	ATSr=n	Change the contents of S register	see "S registers"
12	ATSr?	Read the contents of S register	see "S registers"
		Result code type	
		ATV0 for digit code,	
		ATV1 for text code (default)	
13	ATV	0=0K	
	,	1=connect	
		2=ring	
		3=No carrier	
		4=error	
14	ATZ	Reset (disconnect, enter command mode and restore the	
		flash settings)	
	AT&C	Serial port DCD control	
15		AT&C0=DCD always on	
1.0	A TO 5	AT&C1=DTE detects connection by DCD on/off (default)	
16	AT&F	Restore manufacturer's settings	1 NO14//
17	AT&G	Select guard time	reply "OK" only
18	AT&R	Serial port RTS option command	reply "OK" only
19	AT&S	Serial port DSR control	reply "OK" only
20	AT&V	View settings	
21	AT&W	Write current settings to flash for next boot up	

S Registers

No.	Register	Description	Remarks
1	S0	Ring to auto-answer (default=0)	
2	S1	Ring counter (always=0)	no action applied
3	S2	Escape code character (default=43 ASCII "+")	
4	S3	Return character (default=13 ASCII)	
5	S4	Line feed character (default=10 ASCII)	
6	S5	Backspace character (default= 8 ASCII)	
7	S6	Wait time for dial tone (always=2, unit=sec)	no action applied
8	S7	Wait time for carrier (default=3, unit=sec)	
9	S8	Pause time for dial delay (always=2, unit=sec)	no action applied
10	S9	Carrier detect response time	no action applied
		(always=6, unit 1/10 sec)	
11	S10	Delay for hang up after carrier	no action applied
		(always=14, unit 1/10 sec)	
12	S11	DTMF duration and spacing	no action applied
		(always=100 ms)	
13	S12	Escape code guard time	
		(default=50, unit 1/50 sec)	
		to control the idle time for "+++"
